## RADIO DIAGRAM MANUALS

### New 1957 VOLUME 17 Price \$2.50

Repair quickly all new 1957 sets as well as older radios. This big volume contains clearly printed, large schematics, needed alignment data, replacement parts lists, voltage values, and information on stage gain, location of trimmers, and dial stringing, for all important new 1957 sets. Includes material on portables, clock radios, record changers, FM, and auto sets. A worthy companion to sixteen previous volumes used by over 143,000 shrewd radio servicemen. Large size: 8½ x 11 inches. Manual style binding.

Postpaid, only ..... **\$2.50**

## RADIO DIAGRAMS FOR PREVIOUS YEARS

Speed up and simplify all radio repairs. Service radios faster, better, easier, save money and time, use these **SUPREME Most-Often-Needed** diagram manuals to get ahead. At the low cost (only \$2 for most volumes) you are assured of having for every job needed diagrams and other essential repair data on 4 out of 5 sets you will ever service. Clearly printed circuits, parts lists, alignment data, and helpful service hints are the facts you need. Average volume has 192 pages, large size 8½ x 11 inches. Manual style binding.

INDEX for all Radio and TV Manuals ..... **25¢**

### Practical Radio & Electronics Course

Here is your complete home study course of 53 lessons designed to train any beginner to be an expert in radio and electronics. Covers every topic of radio, electronics, with lessons on test equipment, FM, TV, radio, etc. Giant 8½ x 11 inches, 3-in-1 volume, includes all lessons, instructor's notes, test questions. New edition. Only ..... **\$3.95**

ANSWER BOOK to the above course ..... **25¢**

### RADIO MATHEMATICS

Explains arithmetic and simple algebra in connection with units, color code, meter scales, Ohm's law, alternating currents, ohmmeter testing, wattage rating, series and parallel connections, capacity, inductance, mixed circuits, vacuum tubes, curves, the decibel, etc., and has numerous examples. Only ..... **25¢**

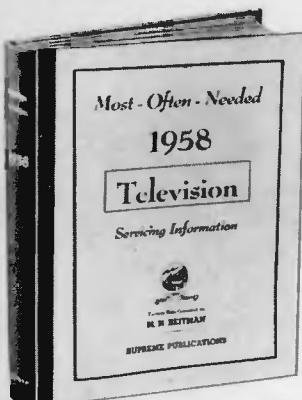

1957-58 RCA Victor TV Manual ... **\$1.50**

### RADIO SERVICING COURSE

Here is your practical radio course of 22 easy-to-follow lessons. Review fundamentals, learn new servicing tricks. Just like a \$200.00 correspondence course. Everything in radio servicing. With self-testing questions. New edition. Price only ..... **\$2.50**

## SUPREME TELEVISION MANUALS

### 1958 TV Manual, TV-14

This new giant volume of 1958 television factory data will give you everything you need to repair and adjust all present-day TV sets. The television series manuals are amazing bargains and defy competition. The 1958 volume contains circuit explanations, 192 pages of alignment facts, test patterns, response curves, waveforms, voltage charts, hints, and dozens of mammoth double-page work-bench diagrams. Large size 8½ x 11 inches. Sturdy covers. Book binding opens flat. Amazing value. Price postpaid, only ..... **\$3**

## EARLIER TV MANUALS FOR 1957 TO 1948

**Supreme TV** manuals cover all needed service material on every popular TV set of every important manufacturer. Here is helpful, practical, factory-prepared data that will really make TV servicing and adjustment easy for you. Supreme giant TV manuals have complete circuits, alignment facts, test patterns, response curves, service hints, recommended changes, voltage charts, waveforms, and many double-page diagram blueprints. Here is your TV service material to help you do more expert work quicker; and priced at only \$3. The **UHF Converters** manual at only \$1.50 has everything you need on UHF. **Radio** manuals described at left.

### How to Modernize Radios

Cash in by improving and modernizing all out of date radio sets and cabinets. Practical job-sheets with schematics and photographs make this work easy. Size 8½ x 11 inches. Your price only ..... **\$1**

## TELEVISION SERVICING COURSE

Let this new course teach you TV servicing. Amazing bargain, complete only \$3, full price for all lessons. Giant in size, mammoth in scope, topics just like a \$200.00 correspondence course. Lessons on picture faults, circuits, adjustments, short-cuts, UHF, alignment hints, antenna problems, trouble-shooting, test equipment, picture analysis. Special, only ..... **\$3**

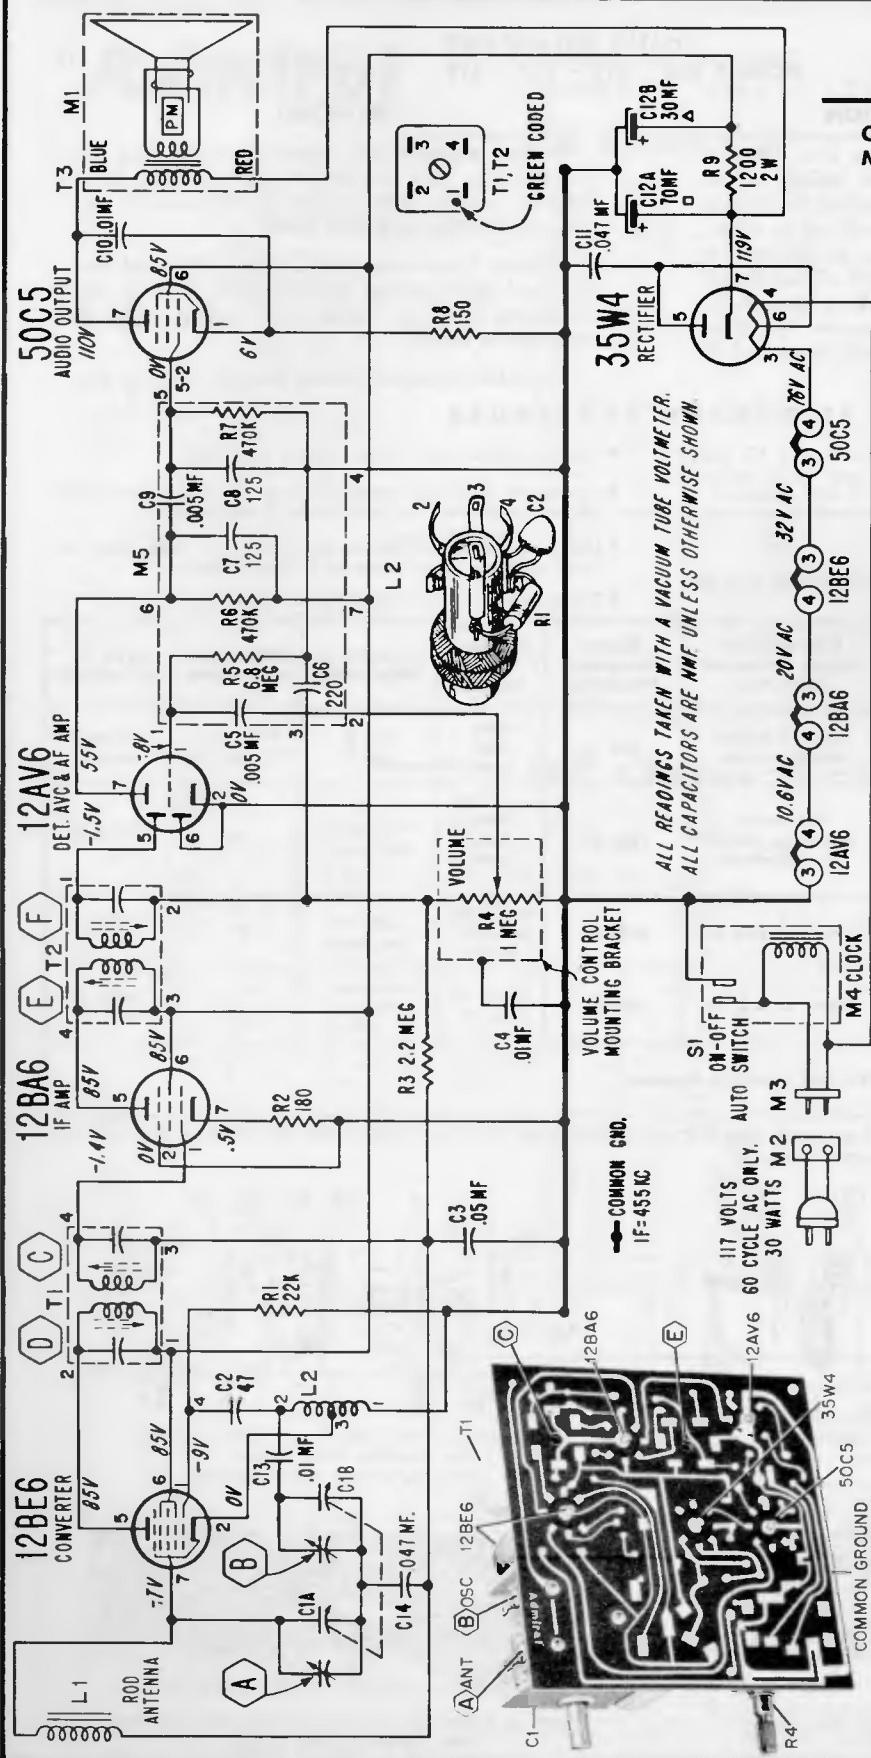

### Simplified Radio Servicing by COMPARISON Method

Revolutionary different **COMPARISON** technique permits you to do expert work on all radio sets. Most repairs can be made without test equipment or with only a volt-ohmmeter. Many simple, point-to-point, cross-reference, circuit suggestions locate the faults instantly. Plan copyrighted. Covers every radio set — new and old models. This new servicing technique presented in handy manual form, size 8½ x 11 inches, 92 pages. Over 1,000 practical service hints. 26 large, trouble-shooting blueprints. Charts for circuit analysis. 114 tests using a 5c resistor. Developed by M. N. Beitman. New edition. Price only ..... **\$1.50**

CHASSIS 5C4  
MODELS 263 • 264 • 265 • 268

**ALIGNMENT PROCEDURE**

STEP	CONNECTION OF SIGNAL GENERATOR	SIGNAL GENERATOR FREQUENCY	RECEIVER GANG SETTING	ADJUSTMENT
1	Through a .1 mf capacitor to stator, Antenna section of gang tuning capacitor	455 KC	Gang fully open	"F", "E", "D" and "C" for maximum output
2	Same as 'STEP 1'	1620 KC	Gang fully open	"B" for maximum output
3	Radiated Signal. Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal pickup.	1400 KC	Tune in on Generator signal	"A" for maximum output

\* Adjustments "C" and "E" made from underside of chassis.

**Admiral**CHASSIS 200 and 4W2  
MODELS 202 • 215 • 217 • 218

(Continued on page 5)

**CHASSIS IDENTIFICATION**

To determine whether the chassis is a 4W2 or 200 series, check the label pasted inside of the cabinet back cover. This label identifies the chassis by number. If the label has been torn out or otherwise removed, the chassis used can be determined by the clearance between the printed wiring board and the top of the cabinet. On the 4W2 chassis there is enough space for storing the power line cord above wiring board. On 200 chassis, line cord is stored below chassis.

**ALIGNMENT PROCEDURE**

- When this set is aligned while operating on the AC power line, an isolation transformer should be used. If an isolation transformer is not available, connect a .1 mfd. capacitor in series with the signal generator low side to B minus (pin 7 of 1U5 tube).
- Set Volume control to maximum.
- DO NOT connect earth ground to common ground (see figs. 2 and 4).

Replace resistors and capacitors by clipping out the defective part and leaving the pigtail leads as long as possible. Then, solder the replacement part onto the remaining pigtail leads.

Remove components such as coils, IF transformers, and tube sockets by alternately heating and loosening each pin. Brush away melted solder as each pin is heated.

Use a low wattage soldering iron, 35 watts or less.

**SERVICING**

- Connect output meter across speaker voice coil.
- Use lowest setting of signal generator capable of producing adequate indication on lowest scale of output meter.
- Use a non-metallic alignment tool with 3/32" wide blade to avoid splitting slotted cores on IF transformers.
- Repeat adjustments to insure good results.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Adjustment Description	Adjustment Designation	Type of Adjustment
1	.1 mfd. capacitor	Stator of antenna tuning capacitor	455 KC	Gang fully open	2nd IF 1st IF	"A", "B", "C" and "D"	Maximum output
2	Loop of several turns of wire, or place generator lead close to receiver for adequate signal pickup.	No actual connection (signal by radiation)	1620 KC	Gang fully open	Oscillator (on gong)	"E"	"Some as Step 1"
3	"Same as Step 2"	"Same as Step 2"	1400 KC	Tune in on generator signal	Antenna (on gong)	"F"	"Some as Step 1"
4 200 chassis only	"Same as Step 2"	"Same as Step 2"	600 KC	"Same as Step 3"	Antenna peaking coil	"G"	"Some as Step 1"
5 200 chassis only	Repeat Steps 3 and 4 until proper tracking is achieved.						

\* Adjustments "B" and "D" on chassis 4W2 are made from foil side. Adjustments "B" and "C" on chassis 200 are made from foil side. Remove chassis to make these IF transformer adjustments.

(Continued from page 4)

## 200 Chassis

## 4W2 Chassis

### REMOVING THE CHASSIS

1. Remove Tuning knob and Volume Control knob by working them forward and off their shafts.
2. Open cover on rear of cabinet.
3. On front of cabinet, loosen, but do not remove, two screws adjacent the tuning shaft.
4. Loosen, but do not remove, the hexnut that secures volume control shaft to cabinet front.
5. On chassis 4W2 only, remove Phillips screw that holds chassis to rear of speaker.

6. On 200 series chassis, remove the 1U4 vacuum tube. Remove the Phillips screw that connects through middle of selenium rectifier.
7. To prevent damage, hold the printed wiring board while removing the two screws and hex-nut located on cabinet front.
8. Gently lift the printed wiring board from within the case.
9. By straightening the four prongs which hold speaker frame to cabinet, the speaker may be removed.

**Admiral**

Chassis 5B4 and 5D4, Continued on page 7.

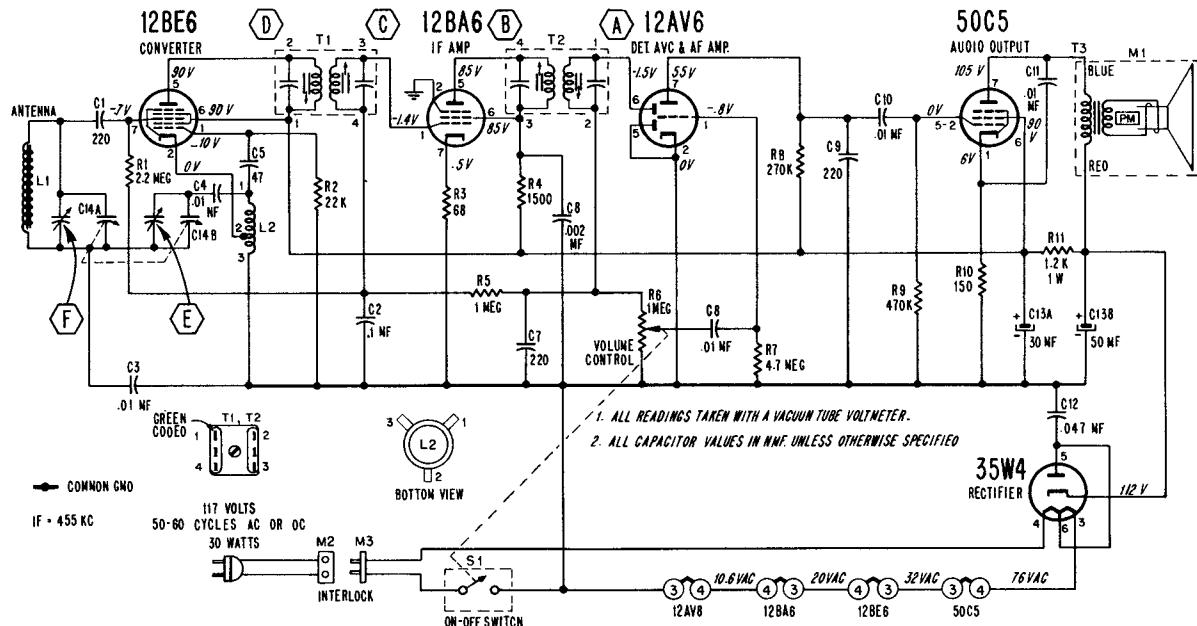

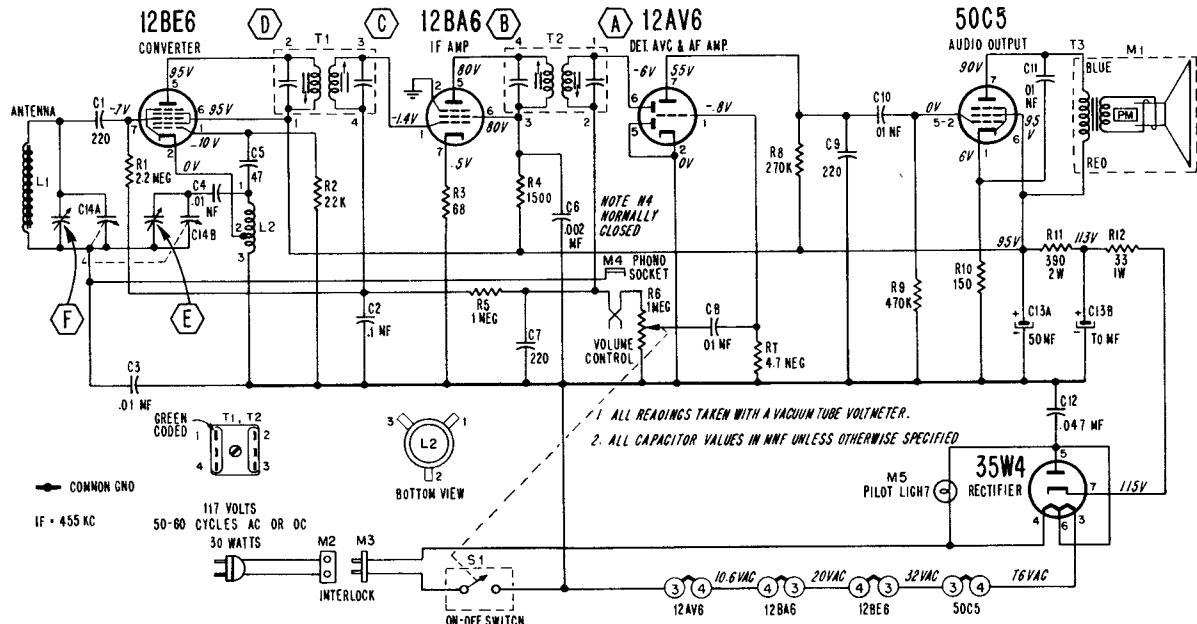

**SERVICING**

Figure 2, refers to the foil side of the printed circuit board. It shows alignment points, tube locations, and location of the common ground line.

Figures 3 and 4, refer to the 5B4 and 5D4 chassis respectively.

Figures 3 and 4 show the location of all resistors, capacitors, coils and transformers.

To further simplify parts identification and location, schematic symbol numbers are printed adjacent to respective components on the printed circuit board.

5D4 (275 • 278 • 279)

(Continued from page 6)

**REMOVING THE CHASSIS**

- Disconnect line cord and remove the two screws located near the front on cabinet bottom. See figure 1.
- Loosen the two chassis retaining screws on the back of cabinet until they are held by only the last threads.
- While steadyng the cabinet, apply pressure to the loosened chassis screws with thumbs. Since the chassis is secured to the panel, this assembly will slide forward.
- Remove the loosened chassis screws.
- Remove chassis and panel assembly by grasping

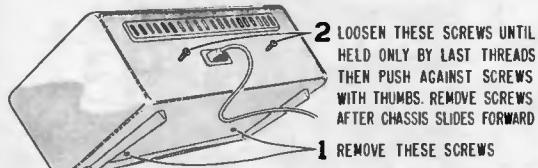

**TO REMOVE CHASSIS FOR SERVICING TUBES**

Figure 1. Rear View of Cabinet Showing Chassis Mounting Screws.

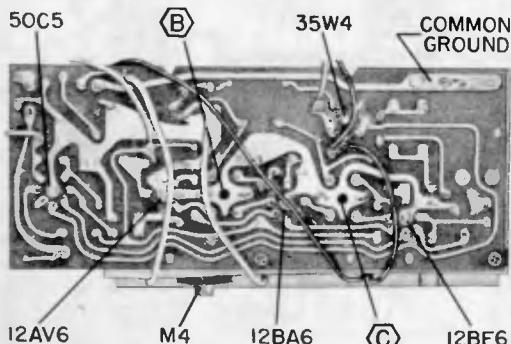

Figure 2. Bottom View of 5D4 Chassis Showing Alignment Points and Tube Locations. 5B4 chassis has same location for tubes and alignment points. Common ground is also the same.

**ALIGNMENT PROCEDURE**

- Use an isolation transformer if available; otherwise, connect a .1 mfd. capacitor in series with low side of signal generator and connect to common ground (see figure 2). Caution: Do not connect a ground wire to common ground.
- Set volume control full on.
- Connect output meter across speaker voice coil.

the control knobs and pulling free from front of cabinet.

- To replace, position chassis and panel assembly inside the cabinet and secure the panel and chassis assembly to the cabinet with the proper screws.

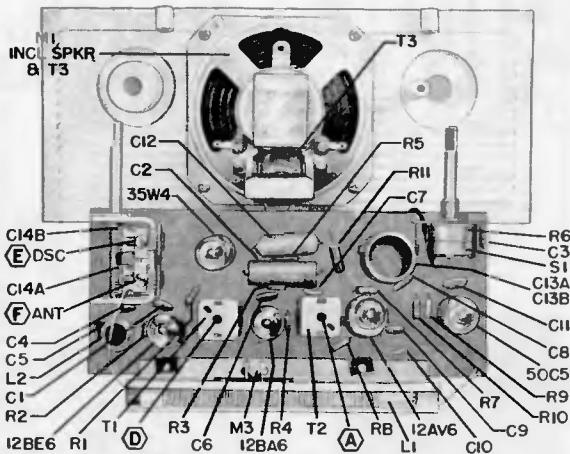

Figure 3. Top View of 5B4 Chassis Showing Location of Components and Alignment Points.

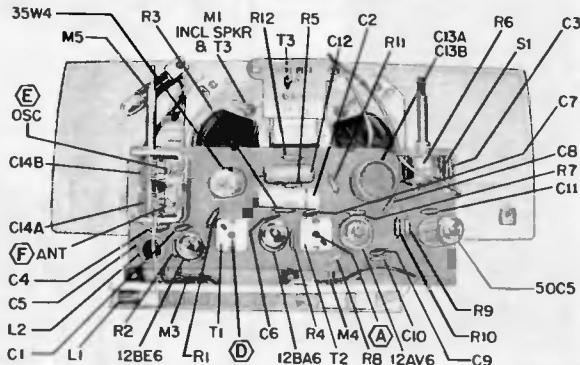

Figure 4. Top View of 5D4 Chassis Showing Location of Components and Alignment Points.

- Use lowest setting of signal generator capable of producing adequate indication on lowest scale of output meter.
- Use a non-metallic alignment tool with a blade 3/32" wide for aligning IF transformers.
- Repeat adjustments to insure good results.

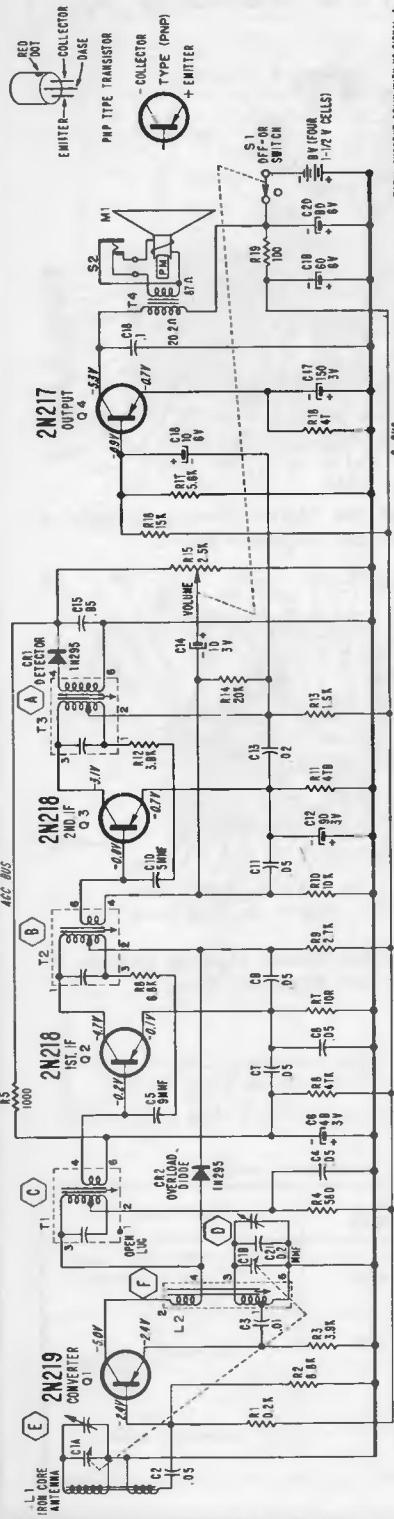

STEP	CONNECTION OF SIGNAL GENERATOR	SIGNAL GENERATOR FREQUENCY	RECEIVER GANG SETTING	ADJUSTMENT
1	Through a .1 mfd capacitor to stator, Antenna section of gang tuning capacitor	455 KC	Gang fully open	"A", "B", "C" and "D" for maximum output
2	Same as "STEP 1"	1620 KC	Gang fully open	"E" for maximum output
3	Radiated Signal. Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal pickup.	1400 KC	Tune in on generator signal	"F" for maximum output

\*Adjustments "B" and "C" made from underside of chassis; see figure 2.

## 6R2B

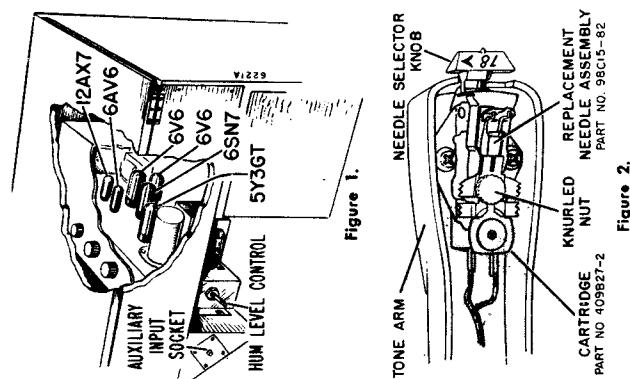

### TROUBLE SHOOTING HINTS

If the phonograph sounds weak or distorted, examine the needles for wear. A worn needle will cause excessive needle scratch and a harshness of treble tones. Test the tubes by substitution and then, if possible, try a new cartridge. Check voltage at tube pins against voltage readings shown on schematic.

**SERVICE NOTE:** The Rej-On-Off pointer (S1) on the record changer is used to turn both amplifier and record changer motor on and off. To turn the amplifier on with the record changer disconnected, a short, temporary jumper wire must be connected between the white and red leads on socket "M6". See schematic.

Amplifier voltage readings may also be taken by connecting the record changer motor plug (M5) to the socket (M6) on the chassis. Unclamp the Tone Arm from the tone arm rest and slide the Rej-On-Off pointer to the "ON" position. Set Loudness control for minimum and Bass and Treble controls to center rotation. Set Compensation control to "LON". Do not play a record while taking readings.

### HI-FI CONSOLE PHONOGRAPH

MODEL	COLOR	CHASSIS	CHANGER
382	Mahogany		
383	Blonde	6R2B	RC637-2
384	Sierra		

### HUM LEVEL ADJUSTMENT

The Hum Level control (R39 on schematic) can be set to eliminate any stray 60 cycle hum appearing in the amplifier output. Make the Hum Level adjustment as follows:

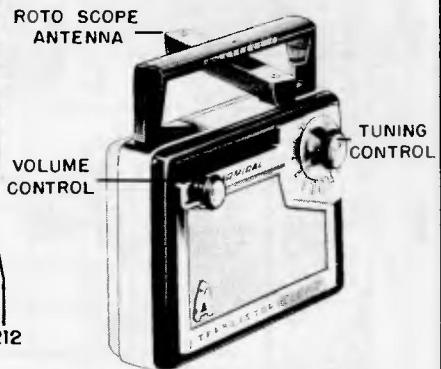

1. Turn set on by sliding Rej-On-Off pointer to "ON". Set Compensation control to "LON"; Bass, Treble and Loudness controls to "MAX" (fully clockwise).
2. Touch record changer centerpost. If hum level of amplifier output increases, reverse line cord in wall outlet. Touch centerpost again. Leave line cord plug in position that gives least amount of hum when centerpost is touched.
3. Find Hum Level control shaft which extends from rear of chassis (see figure 1). Vary control for minimum hum in output. (Setting R39 for minimum hum feeds to control grid of V1A an out-of-phase 60 cycle voltage of an amplitude sufficient to cancel out any stray 60 cycle hum picked up by amplifier.)

### VOLTAGE DATA

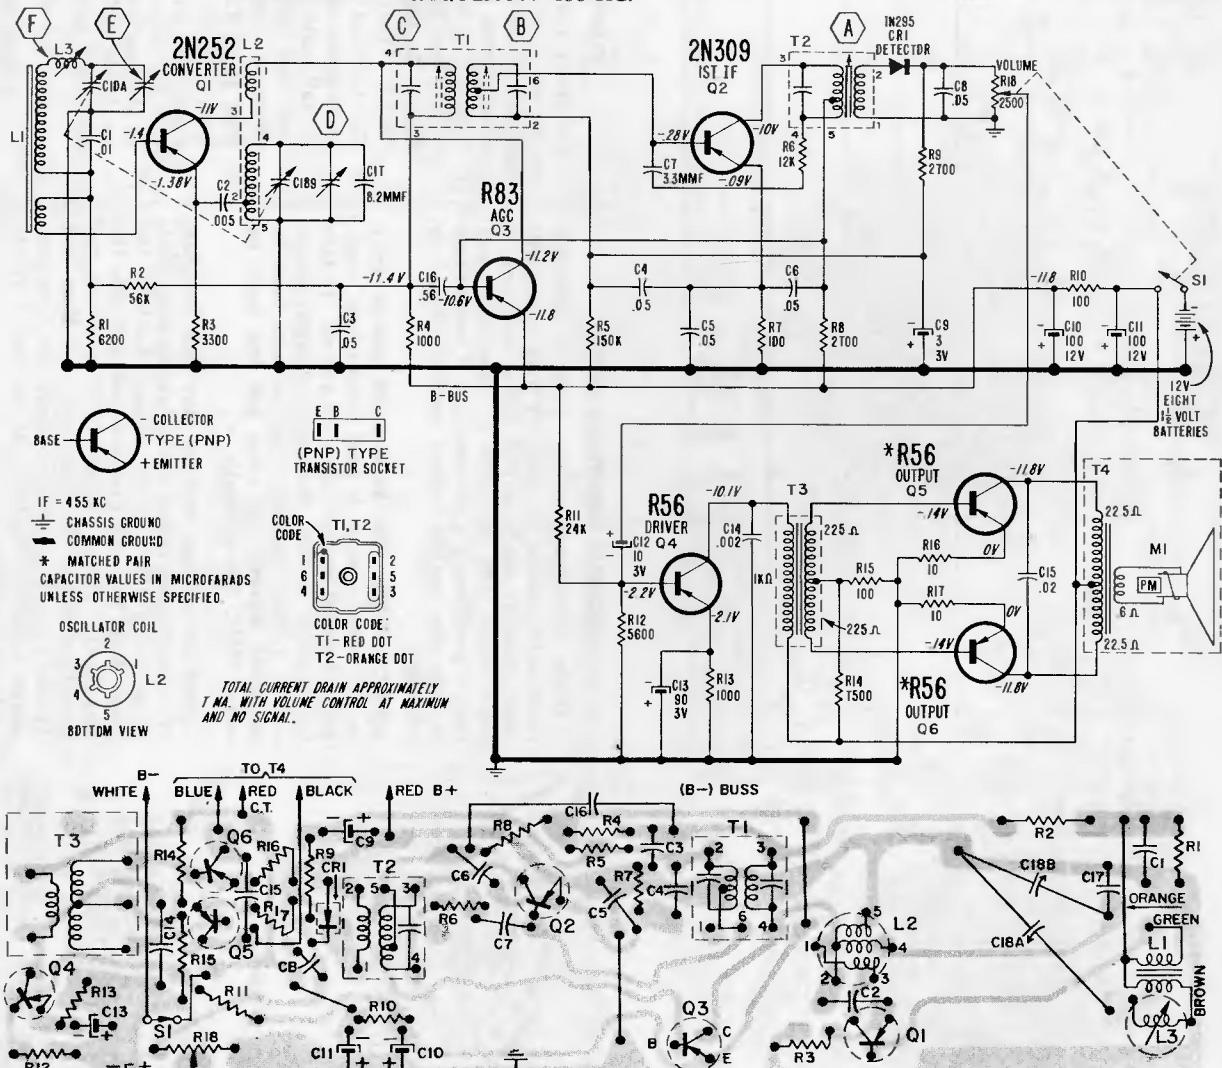

Voltage readings made in reference to chassis ground.

**Capacitors C3 and C4 (included in printed circuit M7, Couplate) total 250 mmf. If it ever becomes necessary to replace M7 with individual components, use any combination totaling 250 mmf to replace C3 and C4 or else place 250 mmf across R6.**

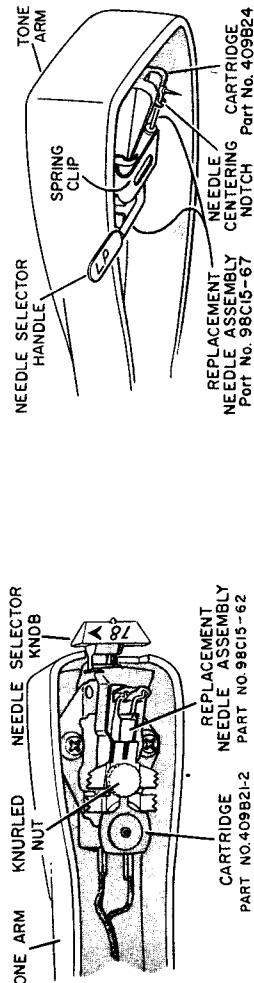

**HUM LEVEL:** Excessive hum can often be minimized by reversing the line cord plug in the wall outlet. Move the Rej-On-Off pointer to "ON". Touch the record changer centerpost and note hum level. Reverse the line cord in wall outlet; touch the centerpost and again note hum level. Leave line cord in the position giving the least hum.

**TROUBLE SHOOTING HINTS**

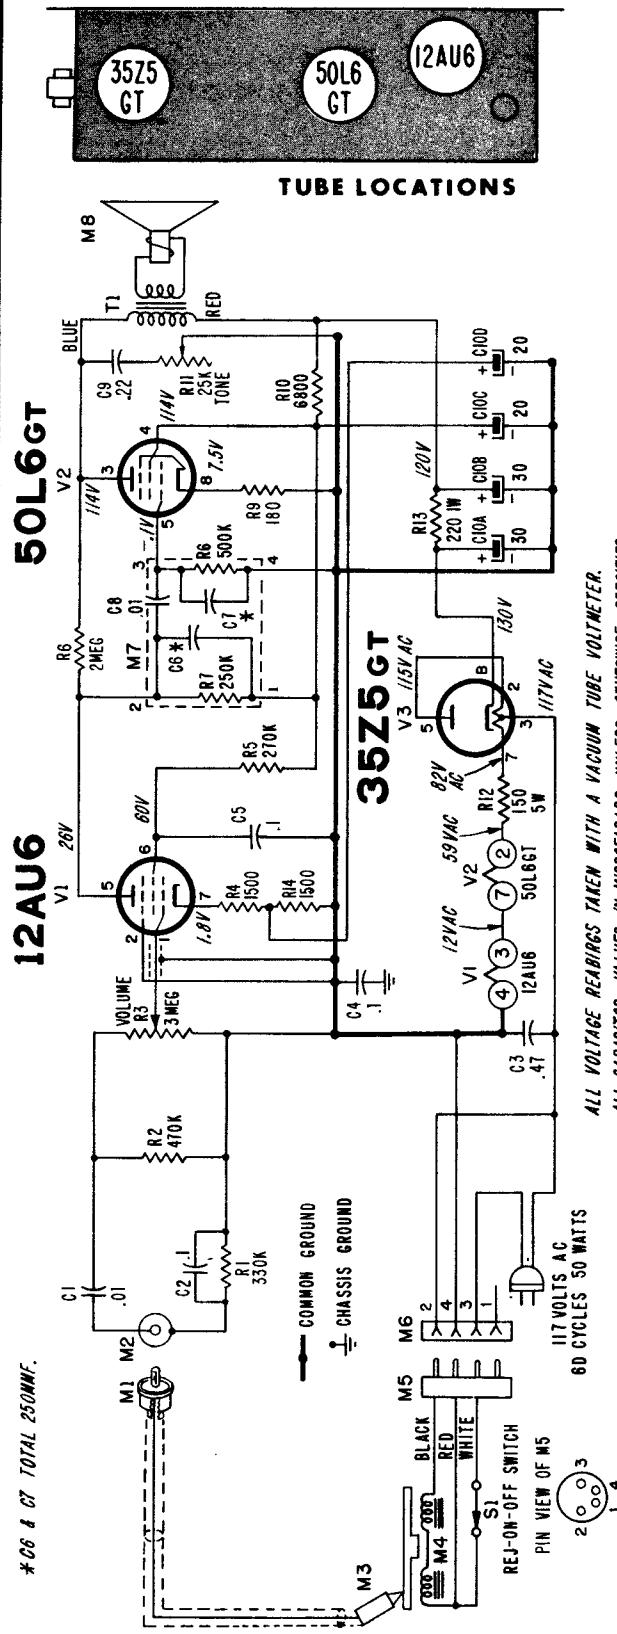

If the phonograph sounds weak or distorted, examine the needles for wear. A worn needle will cause excessive needle scratch and a harshness of treble tones. Test the tubes by substitution and then, if possible, try a new cartridge. Check voltage at tube pins against voltage shown on schematic.

**SERVICE NOTE:** The Rej-On-Off pointer (S1) on the record changer is used to turn both amplifier and record changer motor on and off. To turn the amplifier on with the record changer disconnected, a short, temporary jumper wire must be connected from common ground (4) to the single lead from the AC line cord (3) on socket "M6". See schematic.

Amplifier voltage readings may also be taken by connecting the record changer motor plug (M5) to the socket (M6) on the chassis. Unclamp the Tone Arm from the tone arm rest and slide the Rej-On-Off pointer to the "ON" position. Set volume control for minimum and tone control at the center of its range.

# Admiral MODELS 3J14 and 3J16 (3J1 CHASSIS)

ALL VOLTAGE READINGS TAKEN WITH A VACUUM TUBE VOLTMETER.  
ALL CAPACITOR VALUES IN MICROFARADS. UNLESS OTHERWISE SPECIFIED.

## TUBE AND COMPONENT REPLACEMENT

**TO REPLACE TUBES:** Disconnect the AC line plug from the wall outlet. Remove the hold down screws on either side of the record changer platform. Carefully lift the record changer from the cabinet. For convenience, the record changer motor plug and audio input plug may be disconnected from the chassis, and the record changer set aside.

The audio amplifier uses the following tubes: one 12AU6 (first audio), one 35Z5GT (rectifier) and one 50L6GT (audio output). See "Tube Locations".

After servicing tubes, reconnect the record changer motor plug and audio output plug, replace both hold down screws and tighten securely.

**TO REMOVE THE CHASSIS** from the cabinet, follow the procedure outlined under "To Replace Tubes", then proceed as follows:

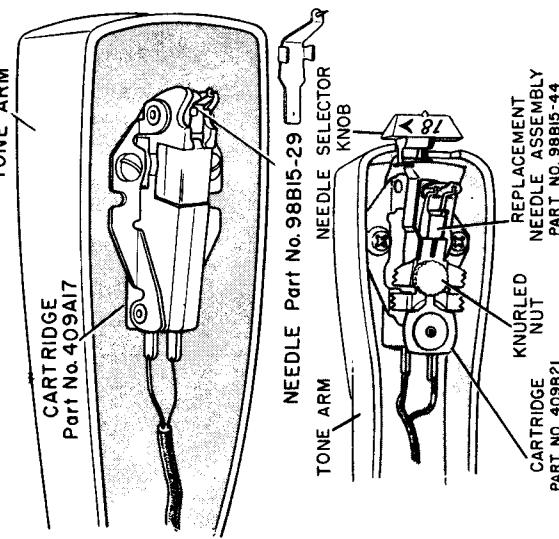

Remove the five speaker compartment cover mounting screws and lift the cover from the cabinet.

Remove the three nuts that hold the chassis to the cabinet. Remove the nuts that hold the speaker to the cabinet. The output transformer leads are soldered to the speaker; speaker and chassis must be removed as a unit.

**SERVICE NOTE:** The "REJ-ON-OFF" pointer (S1) on the record changer is used to turn both amplifier and record changer motor on and off. To turn the amplifier on with the record changer disconnected, a short, temporary jumper wire must be connected from common ground (4) to the single lead from the AC line cord (3) on socket "M6". See schematic.

Amplifier voltage readings may also be taken by connecting the record changer motor plug (M5) to the socket (M6) on the chassis. Unclamp the TONE ARM from the tone arm rest and slide the "REJ-ON-OFF" pointer to the "ON" position. Set volume

control for minimum and tone control at the center of its range.

**DELCO**

PONTIAC MODEL 988671

(Continued from page 38)

## TROUBLE SHOOTING THE OUTPUT STAGE

A quick way to determine that the 2N173 is conducting can be made by checking the collector voltage, from transistor case to the radio case. If no voltage is present the transistor is not conducting or the transistor heat radiator is grounded to the radio case. If the voltage at the collector is higher than listed the transistor is conducting too heavily (check with milliammeter) or the output transformer is open. The amount of current the transistor conducts is determined by the voltages at each element, the resistor in the base and emitter circuits, the input transformer secondary resistance, and the transistor itself.

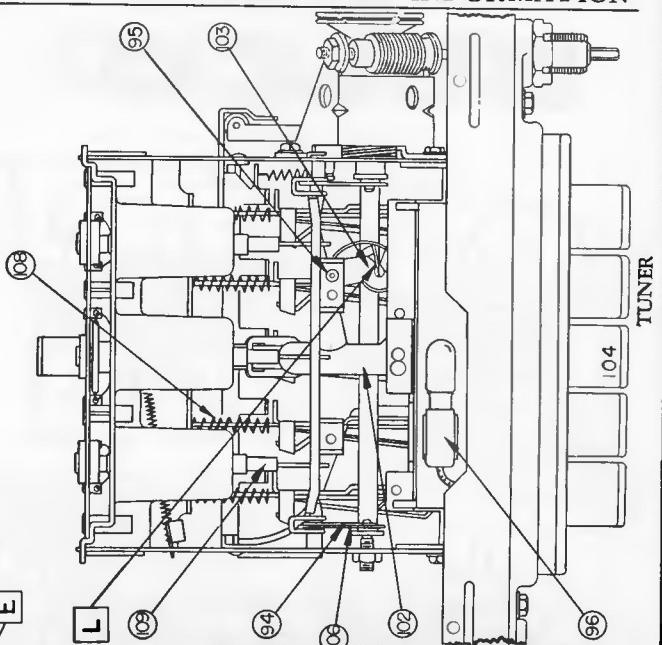

## ALIGNMENT PROCEDURE:

Steps	Series Capacitor or Dummy Antenna	Connect to	Signal Generator Frequency	Tune Receiver to	Adjust in Sequence For Max. Output
1	0.1 Mfd.	12BE6 Grid (Pin #7)	262 KC	High Frequency Stop	A, B, C, D

## TROUBLE SHOOTING THE OUTPUT STAGE

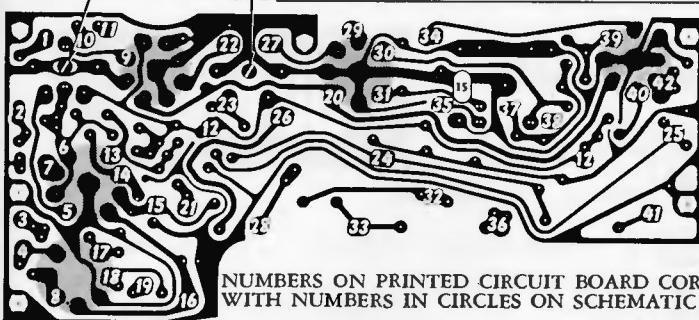

A quick way to determine that the 2N278 is conducting is by checking the collector voltage, from transistor case to the radio case. If no voltage is present, the transistor is not conducting or the transistor heat radiator is grounded to the radio case. If the voltage at the collector is higher than listed, the transistor is conducting too heavily (check with milliammeter) or the output transformer is open. The amount of current the transistor conducts is determined by the voltages at each element, the resistor in the base and emitter circuits, the input transformer secondary resistance, and the transistor itself. The most common defect in the transistor is an internal short between emitter and collector. To check for this, use the following procedure.

1. Unsolder base and emitter leads from the circuit.
2. Set ohmmeter on the "R x 1" scale (no other scale should be used.)
3. Place negative lead of ohmmeter (polarity refers to internal ohmmeter battery) on collector, and positive lead on the emitter.
4. The transistor is shorted if reading is "O".

#### ALIGNMENT PROCEDURE

Output Meter Connections...Across Voice Coil Generator Return.....To Receiver Chassis  
Dummy Antenna .....In Series With Generator

Volume Control Position.....Maximum Volume  
Tone Control Position.....Treble Position  
Generator Output.....Minimum for Readable Indication

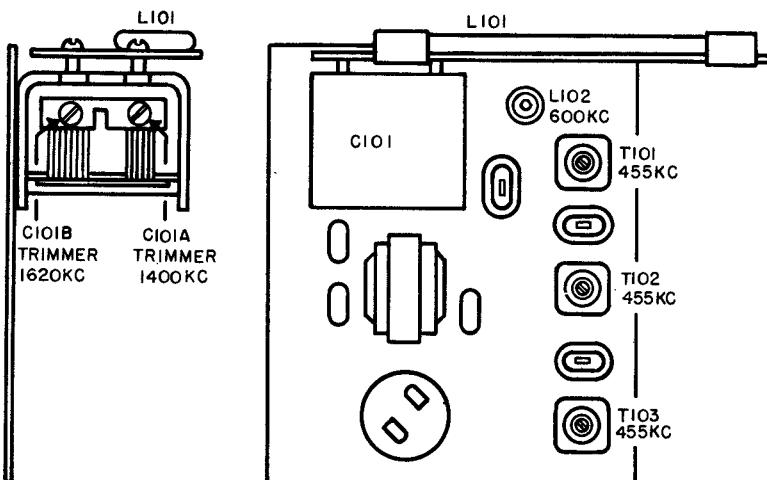

CONNECT VACUUM TUBE VOLTMETER ACROSS SPEAKER VOICE COIL DURING ALIGNMENT.

Steps	Series Capacitor or Dummy Antenna	Connect Signal Generator to	Signal Generator Frequency	Tune Receiver to	Adjust in Sequence For Max. Output
1	0.1 Mfd.	12AD6 Grid (Pin #7)	262 KC	High Frequency Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	600 KC	Signal Generator Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G
5	0.000068 Mfd.	Antenna Connector	1100 KC	Signal Generator Signal	L**

\*Before making this adjustment check mechanical setting of oscillator core "H." The rear of the core should be 1% from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustment should be made with a non-metallic screw driver.

\*\*L is the pointer adjustment which is on the connecting link, between the pointer assembly and core guide bar (See tuner Dwg.). It should be adjusted so that when looking directly at the dial the pointer is on the 1100 KC mark. This setting is to give the correct relationship between the pointer and the dial when the radio is installed in a car.

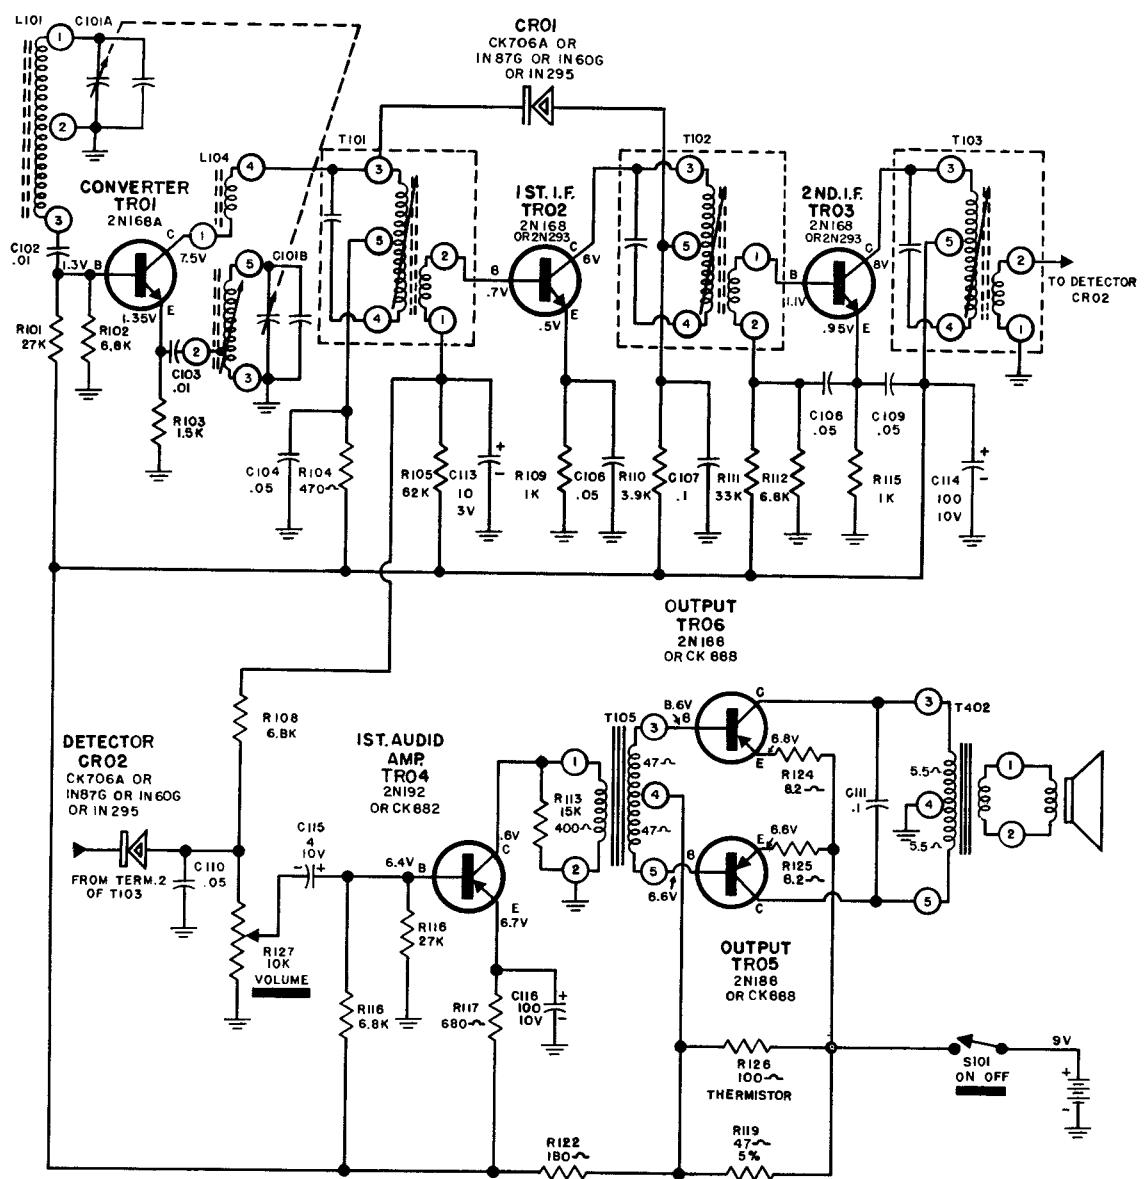

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station between 600 and 1000 KC (see sticker on case).

Model 1210 (RA-902)

(Continued on page 55,  
adjacent at right.)

**DU MONT****MODEL 1210 (RA-902)**

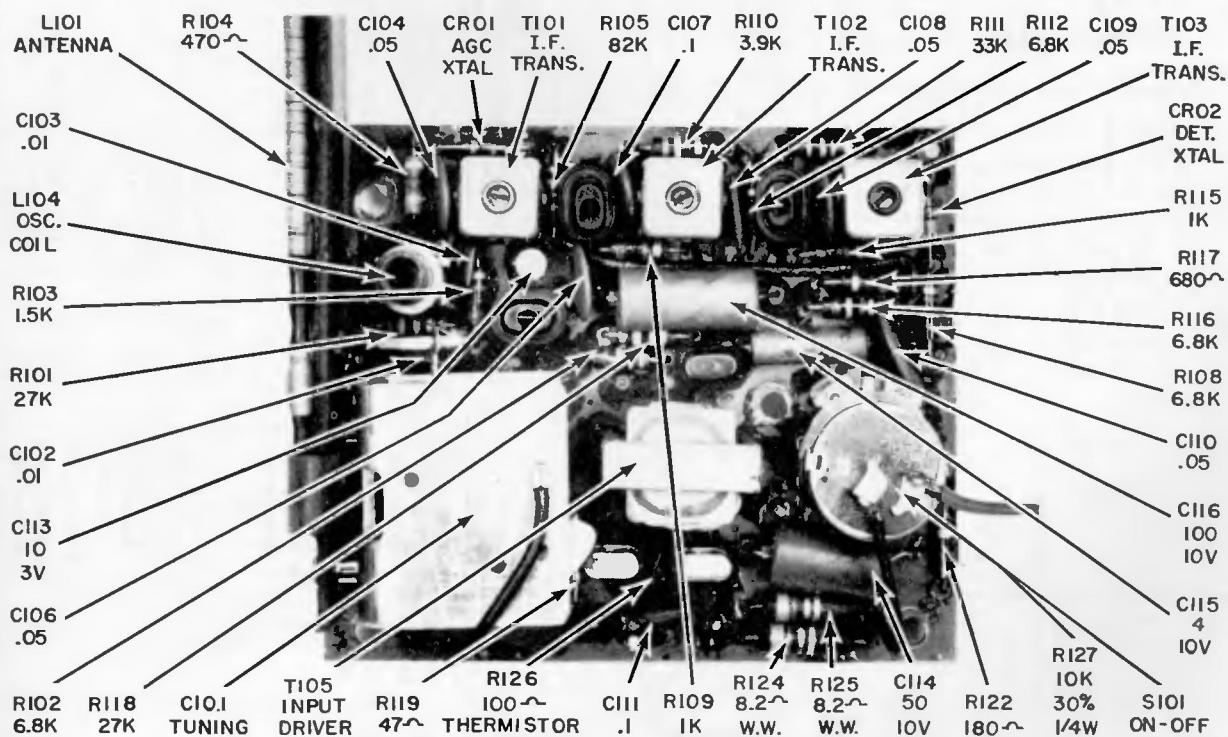

(Continued from page 54, adjacent at left)

**ALIGNMENT INSTRUCTIONS**

Turn volume control fully clockwise. Adjust the generator for the lowest signal necessary to obtain an output reading (no more than .5 volts across speaker voice coil). Make all adjustments with an insulated alignment tool. Caution: Do not remove or insert transistors while power is on.

Step	Signal Generator		Tuning Capacitor Setting	Output Meter Connection	Adjust
	Frequency	Connect to			
1	455 KC 400 cps AM Mod.	Loop, of several turns of wire placed near AM antenna	Maximum Capacity		I. F. Transformers T103, T102 and T101 in this order for maximum output indication. Repeat once.
2	1620 KC 400 cps AM Mod.	As Above	Minimum Capacity		Oscillator trimmer capacitor of C101B until signal is heard, but don't attempt to tune for peak output. Note: If signal cannot be heard adjust antenna trimmer capacitor of C101A.
3	As Above	As Above, except move loop several feet away for very weak signal.	As Above		Antenna trimmer capacitor of C101A for maximum signal output. Retouch oscillator trimmer for maxi- mum output.
4	600 KC 400 cps AM Mod.	As Above	Set tuning dial for strongest 600 KC signal		Oscillator coil, L102, rocking tuning capacitor back and forth until signal reaches maximum.
5	1400 KC 400 cps AM Mod.	As Above	Set tuning dial for strongest 1400 KC signal		Antenna trimmer capacitor of C101A, and at the same time rocking tuning capacitor back and forth until signal reaches maximum. Note: Repeat steps 4 and 5 if necessary.

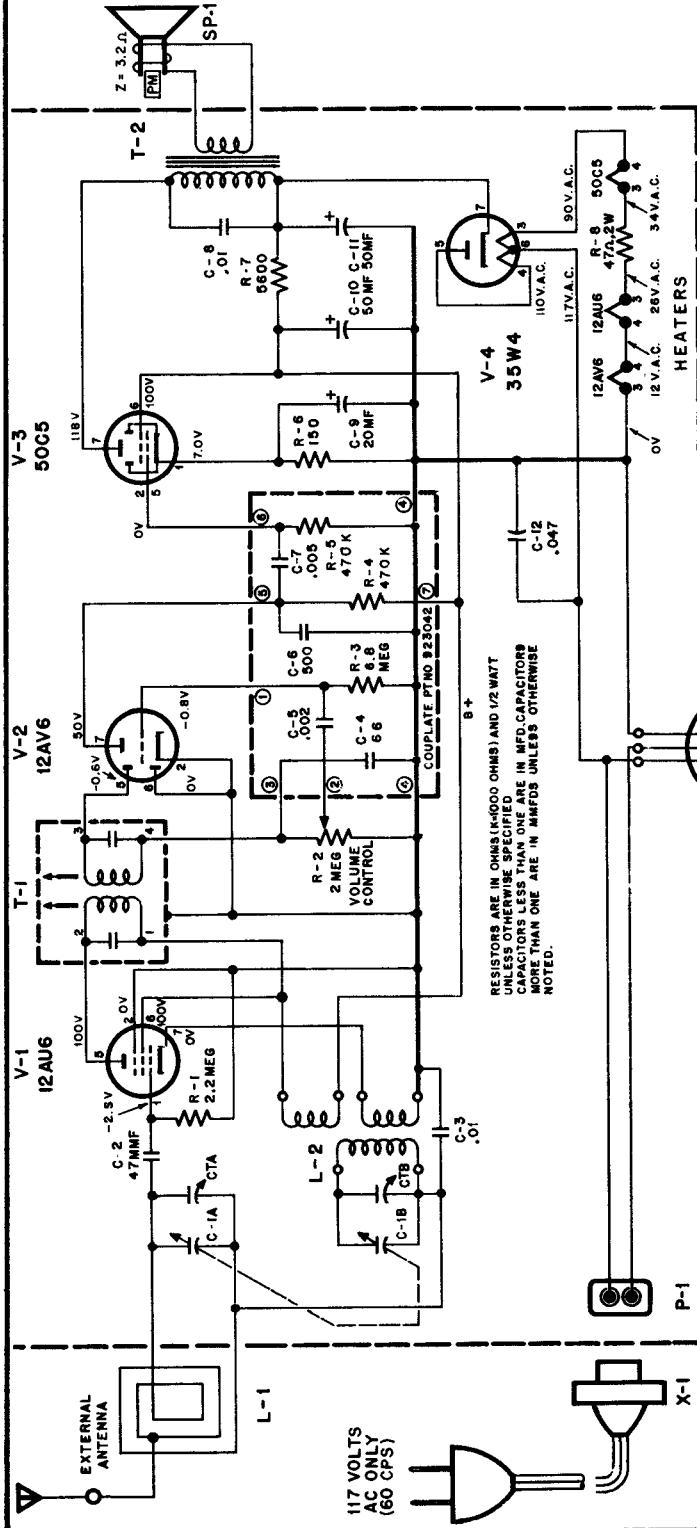

NOTE: When the chassis and/or battery compartment are reinstalled in the case, tune the radio to a weak AM station above 1400 KC, and retouch the antenna trimmer capacitor, C101A, for peak performance.

## REPAIR OF COUPLES

Whenever possible couples should be repaired instead of replaced. This practice could readily become a time saving factor.

**Example #1**  
Shorted .005 mfd condenser C-6.  
Clip off pin 6 of couple from printed board. This removes C-6 and R-7 from the circuit.

Insert a regular 470K ohm  $\frac{1}{2}$  watt resistor from B-neutral (Pin 4 of Couple) to pin 2 of V-4 and a regular .005 mfd 400V condenser from pin 2 of V-4 to pin 5 of Couple.

**Example #2**  
Open R-7 470K ohm resistor. Insert regular 470K ohm  $\frac{1}{2}$  watt resistor across pins 4 and 6 of Couple.

# Emerson Radio

MODEL - 867B  
CHASSIS - 120366B

This model is identical to the model 867B using chassis 120349B except for the substitution of a couplet (Emerson Pt. No. 923041) and individual components on chassis 120366B for the two modules used on chassis 120349B.

## DISASSEMBLY INFORMATION

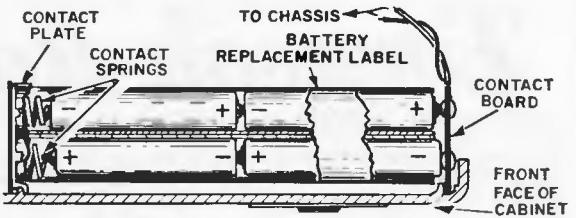

1. Remove all knobs and remove masonite back.
2. Remove 2 "C" and 2 standard washers securing changer hold down bolts to mounting board (which is part of cabinet), remove 2 three-prong plugs and remove changer (unstaple fish paper wire holders.)
3. To remove radio:
  - a) Remove AC interlock, slide off pilot light assembly.
4. To reassemble, reverse procedures #1 through #3.

## ALIGNMENT INSTRUCTIONS

STEP	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS

2		Form loop of several turns and radiate signal into receiver	1620 KC	"	Across voice coil.	Trimmer C-TB (Osc.)	Adjust for maximum output.
3			1400 KC	Tune for maximum output.	Across voice coil.	Trimmer C-TA (Ant.)	Adjust for maximum output.

# Emerson

Chassis 120374, Model 888

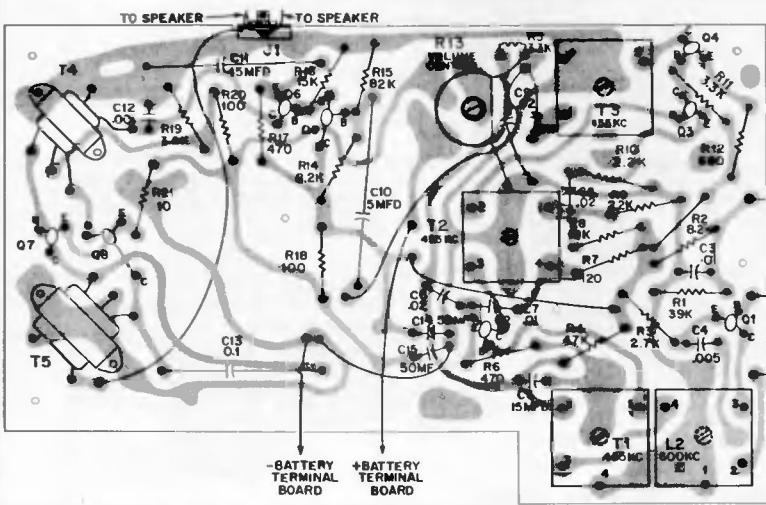

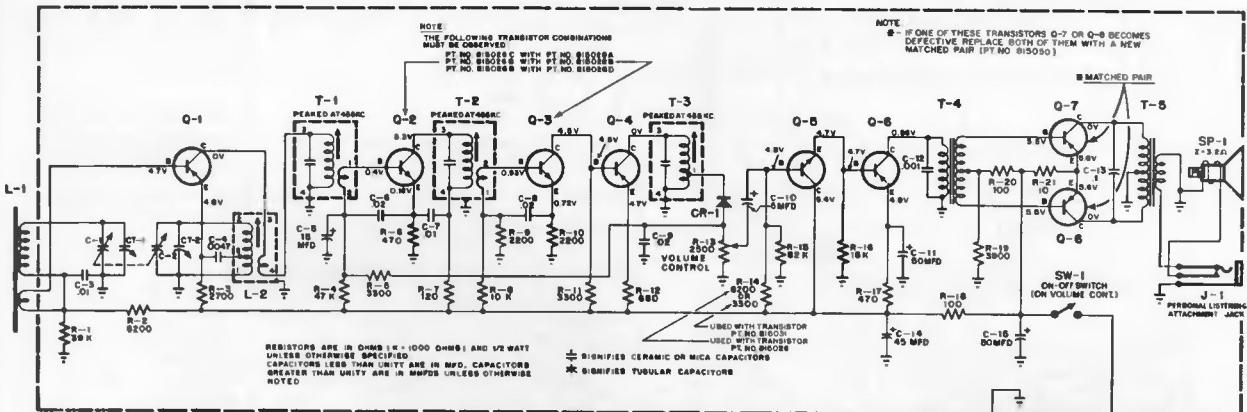

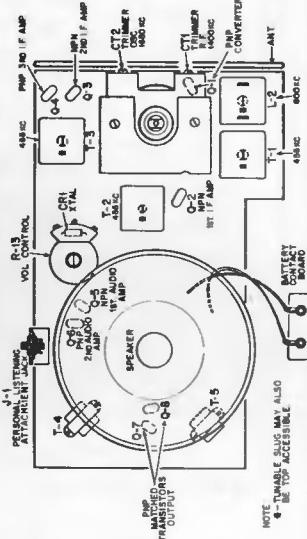

## ALIGNMENT INSTRUCTIONS

Volume control should be at maximum; output of signal generator should be no higher than necessary to obtain an output reading with a 30% audio modulated R.F. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to junction of L-1 & C-1. Low side to chassis.	455 KC.	Tuning condenser fully open.	Across voice coil.	T2, T3 and T1	Adjust for maximum output starting with T3.
2		Use a loop set perpendicular and about 20" from center of bar loop ant. in set.	1650 KC.	Tuning condenser fully open.	Across voice coil	CT2 (osc. trimmer) See note below	Fashion loop of several turns of wire and radiate signal into bar loop of receiver. Adjust for maximum output.
3		"	1400 KC.	Tune for maximum output.	Across voice coil.	CT1 (Ant. trimmer)	Adjust for maximum output.
4		"	600 KC.	Tuning condenser set for 600 KC.	Across voice coil.	Osc. slug in L-2	Rock the variable cond. each side of 600 KC while adj. osc. slug for maximum response.
5		"	1650 KC.	Tuning condenser fully open.	"	CT2 Osc. trimmer	If readjustment is necessary repeat steps 2 to 4 until no further improvement is noted.

NOTE: For optimum results, repeat entire alignment procedure.

## CONDITIONS FOR VOLTAGE READINGS

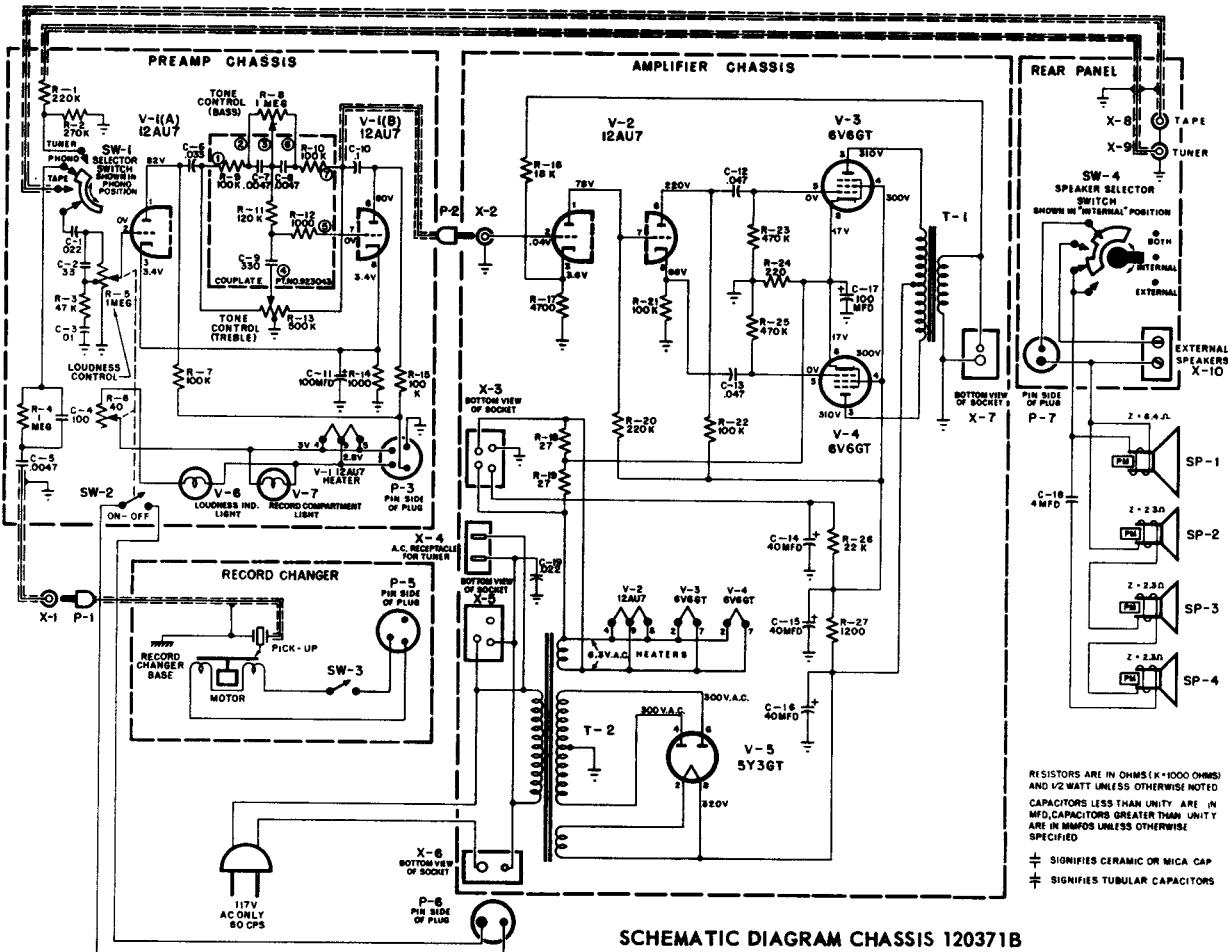

1. Voltages indicated are positive D.C.
  2. Measurements taken with V.T.V.M.
  3. All Measurements taken between points and chassis.
  4. Voltage measurements taken with:
    - (a) Fresh 6 Volt battery supply. Four 1½ Volt conventional penlight cells.
    - Note: Should Mercury or Nickel-Cadmium batteries be used, an approx. 15% lower voltage reading will be obtained from the battery supply which is considered to be perfectly normal.
    - (b) Volume control set for maximum volume.
    - (c) Variable capacitor fully closed and no signal applied.
  5. Nominal tolerances in component values make possible a variation of  $\pm 15\%$  in readings.
- Caution - When taking voltage checks, avoid accidental shorting across transistor leads as they may cause transistor damage. Do not use a non-vacuum tube-type voltmeter as the relatively low shunt resistance of this type of voltmeter can easily disrupt the transistor bias and result in erroneous readings as well as damage to the transistor.

## TO REMOVE CHASSIS FROM CABINET

To remove chassis from cabinet, remove cabinet back. Unsolder the output transformer leads from the speaker. Remove the four self-tapping screws, (hex-heads) one on each corner of the chassis, and the single hex screw just below the tuning gang capacitor. Pull off the volume control knob. The tuning control knob is held to the cabinet, so the chassis must be pulled out of the cabinet, at the same time pulling it off the tuning knob which remains on the cabinet. When pulling out the chassis, it is best to grasp the tuning capacitor (C1) by the thumb and forefinger of one hand, the tuning knob by the other hand and pull.

**CAUTION:** It is important to use extreme care replacing parts and/or soldering on this chassis. Too much heat on the chassis will cause the copper plating to become unbonded. Only apply the soldering iron long enough to melt the solder and pull out the part to be replaced.

## Models T105 and T106

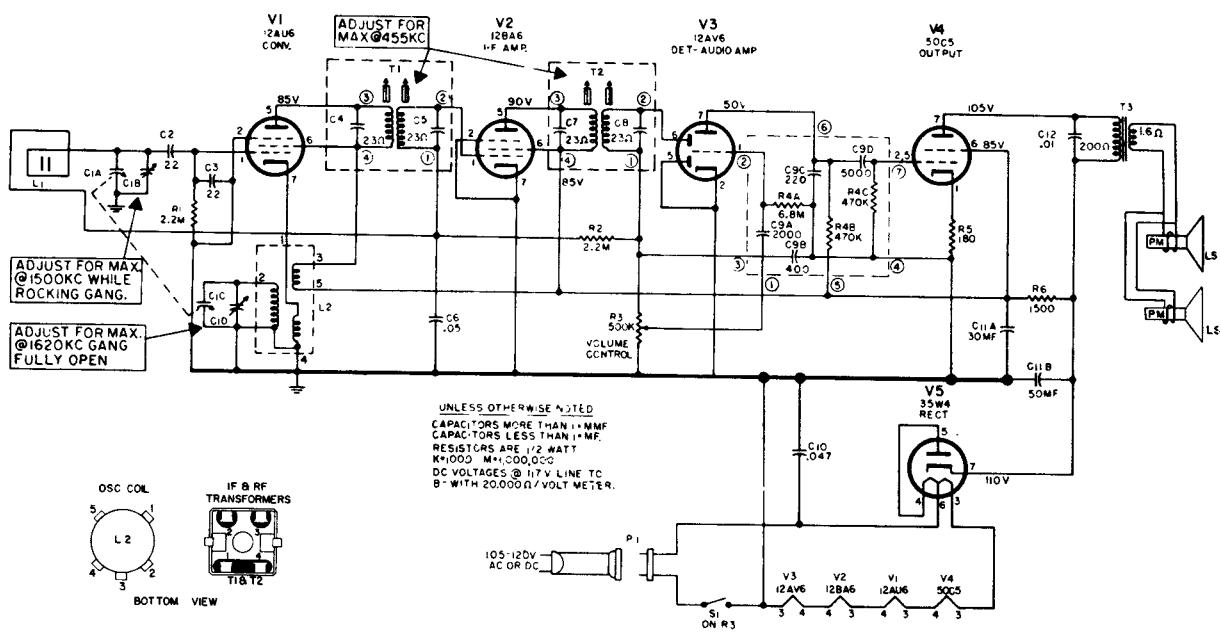

### TO REPLACE A TUBE SOCKET

Cut the socket free by cutting all of the socket terminals at the chassis and unsolder the center terminal. Now, heat each terminal only enough to push it out. The new socket can now be inserted into place.

### TO REPLACE THE VOLUME CONTROL

Remove the shaft nut and the fibre washer, then cut the center and lower terminals. Apply only enough heat to the upper terminal to pull out the control. Apply heat to the center and lower terminals so they may be pushed out. The new control may now be inserted into place and soldered. Make sure the fibre washer is in place before installing the shaft nut. NOTE: The shield cans on T1 and T2 can be removed by unfastening the two spring clips and lifting the cans off the transformers, thereby leaving the coils open for inspection or repair.

ALIGNMENT CHART				
STEP	CONNECT TEST OSCILLATOR TO	TEST OSC. SETTING	TUNING GANG SETTING	ADJUST FOR MAX. OUTPUT

**GENERAL ELECTRIC**

Models T115 and T116

**TO REMOVE CHASSIS FROM CABINET**

1. Remove the cabinet back by unscrewing the 5 screws.
2. Pull off the three knobs.
3. Remove tone control from bracket.
4. Unsolder the 2 leads which connect the speaker to the chassis.
5. Remove cabinet front by unscrewing the 2 screws on the bottom rail; also the screws on the tone control and volume control brackets.

**TO REMOVE SPEAKERS**

1. Remove grille by unscrewing the 4 corner screws on the inside of the cabinet front.
2. Remove the speakers by removing the screws on the front of the speaker.

Label the speaker leads before unsoldering them from the speakers; incorrectly connecting the leads will cause distorted audio.

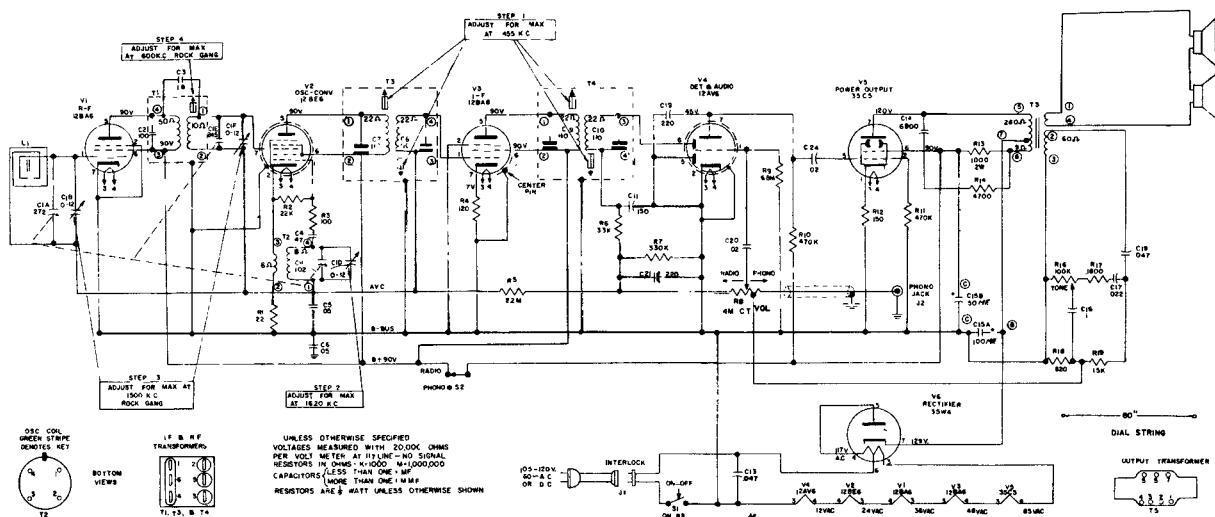

NOTE: The radio-phono switch on the rear of the cabinet should be in the "radio" position before starting alignment procedures.

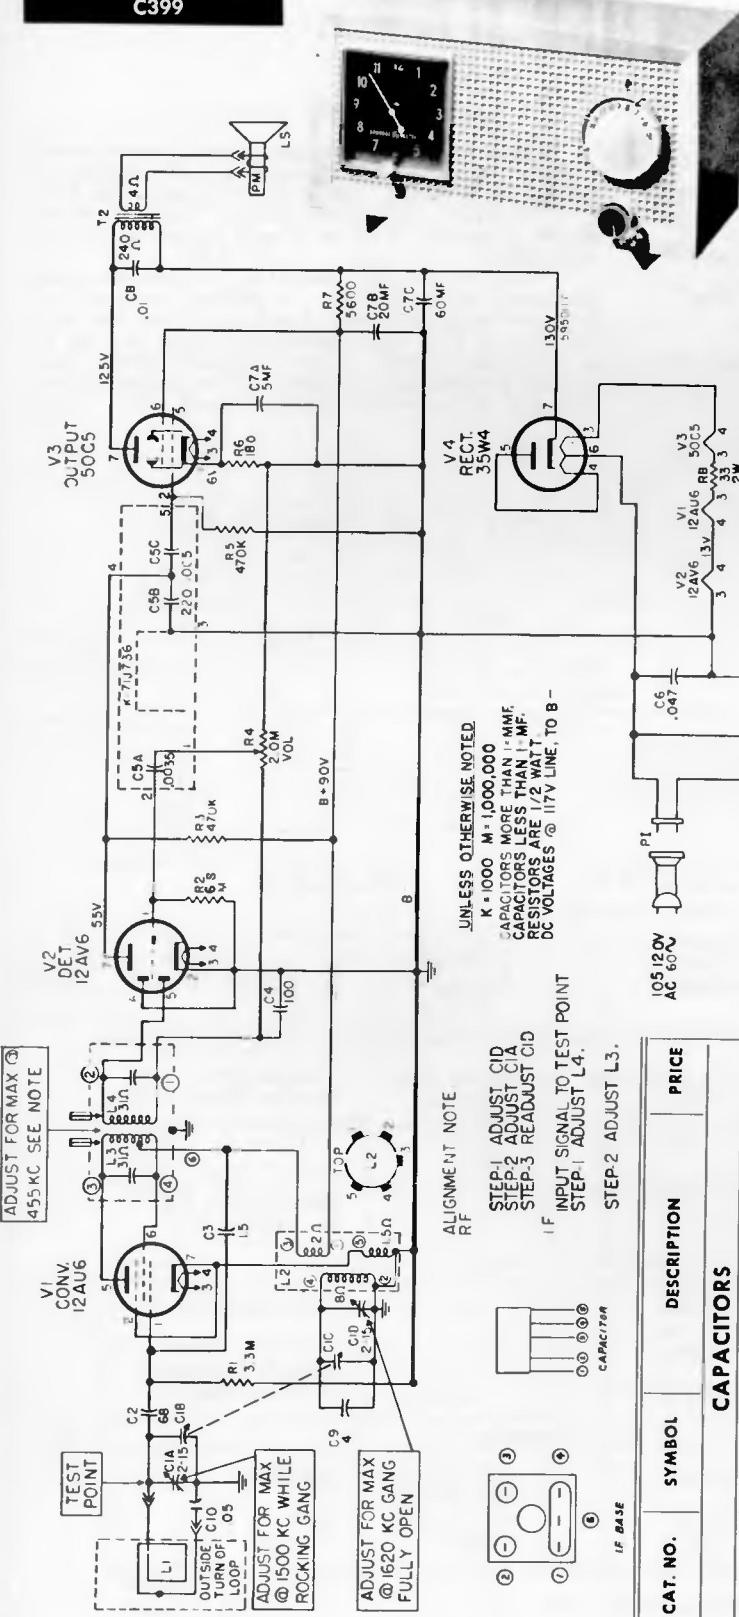

Always have Volume Control set for maximum, and reduce signal input so AVC will not affect output.

# GENERAL ELECTRIC

Models C415, -A, -B, C416, -A, -B, and C417

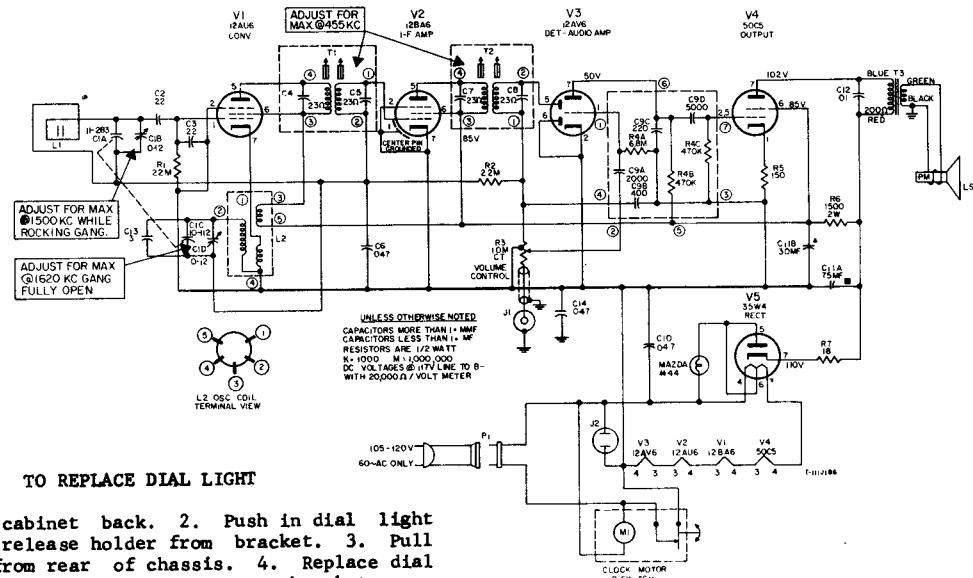

## TO REMOVE CHASSIS FROM CABINET

1. Remove tuning, volume and timer knobs.
2. Remove time set knob from shaft at back of cabinet. Hold shaft and turn knob counter clockwise.
3. Remove five hex-head screws on cabinet back.
4. Remove four hex-head screws on bottom of cabinet.
5. Remove Snooz-Alarm knob.
6. Remove timer by unscrewing four Phillips head screws.
7. Unsolder speaker leads from speaker.
8. Pull chassis out slowly. Leads from chassis to timer remain attached for A. C. while testing.

## CAUTION

The chassis uses the dip solder copper-plated printed circuit to eliminate most of the interconnecting wiring. When soldering, keep the heat to a minimum to prevent the printed wiring from becoming unbonded. A 35 to 50 watt soldering iron is recommended.

Always use an isolation transformer when servicing this receiver. To protect the test equipment being used when aligning, connect the output lead of the signal generator to the grid of an I. F. tube through a .05 capacitor. This will prevent the output impedance of the generator from having a loading effect on the circuit.

## TO REPLACE DIAL LIGHT

1. Remove cabinet back.
2. Push in dial light holder and release holder from bracket.
3. Pull holder out from rear of chassis.
4. Replace dial light.
5. Insert holder and snap on bracket.

STEP	CONNECT TEST OSCILLATOR TO	TEST OSCILLATOR SETTING	TUNING GANG SETTING	ADJUST FOR MAXIMUM OUTPUT

Models C420 and C421

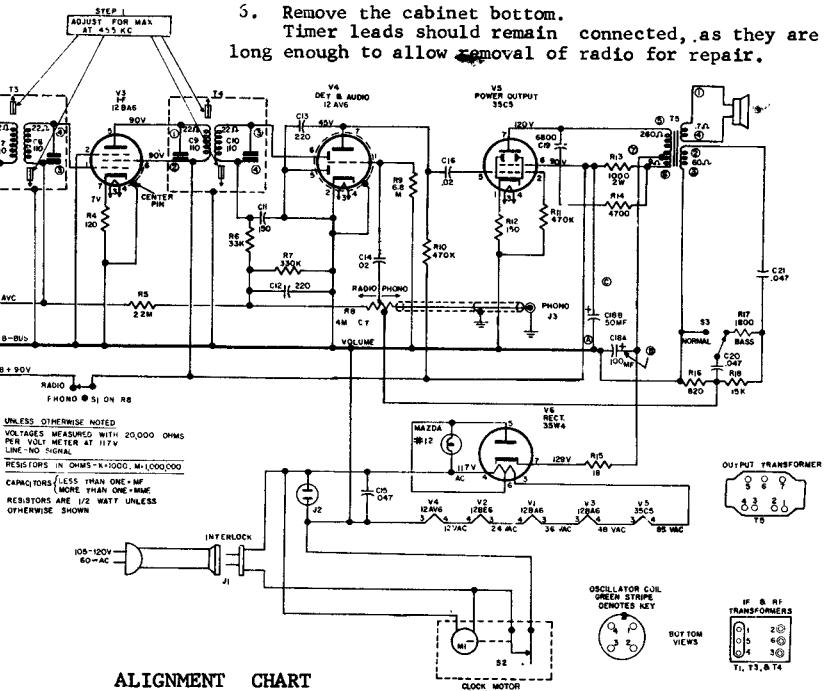

## TO REMOVE SPEAKER

- Follow steps 1 through 5 as above.
- Remove the 4 hexhead screws from around speaker. This will remove the speaker and speaker grille.

## TO REMOVE CHASSIS

- Remove volume and tuning knobs.
  - Unscrew alarm set indicator knob (Rear)
  - Remove back of cabinet.
  - Unsolder leads from speaker.
  - Remove the cabinet top.
  - Remove the cabinet bottom.
- Timer leads should remain connected, as they are long enough to allow removal of radio for repair.

# GENERAL ELECTRIC

Models P710A, -B, -C, -C, and P711A, -B, -C, -C, (Continued on the next page at right)

#### TO REMOVE CHASSIS FROM THE CABINET

Pry off the cabinet back by using a small coin in the slots provided on the bottom of the case. Pull off the volume control knob. Remove the tuning knob by unscrewing the thumb screw in its center in a counterclockwise direction; then pull off the large knob. Remove the Phillips flat head screw located under the tuning dial. Also remove the two Phillips head screws located on the speaker end of the chassis. This will enable the chassis to come free from the cabinet front.

This receiver is of dual chassis design. The speaker, loop antenna, volume control, and tuning condenser are mounted on the upper metal chassis. All transistors, transformers, and components are soldered on the etched circuit board.

To separate the metal chassis from circuit board unsolder the two tabs that hold the volume control to the metal chassis; unsolder the lead from the loudspeaker; unsolder the lead from the top lug of the tuning gang oscillator section and two loop leads to the chassis board; carefully bend the two mounting lugs on the speaker end of the circuit board and one on the tuning condenser end; also unsolder the lug near the phone jack; then gently pull off the circuit board. The tuning condenser, loop antenna, and speaker will remain on the metal chassis.

#### COMPONENT REMOVAL

To remove the speaker from the radio, unsolder one speaker lead and carefully bend over condenser C13 and remove speaker mounting screw.

Remove the tuning condenser by unscrewing the two mounting screws located on the face of the metal chassis.

To replace the volume control, unsolder the three volume control leads at the control and the two switch leads on the back of the control.

#### ALIGNMENT

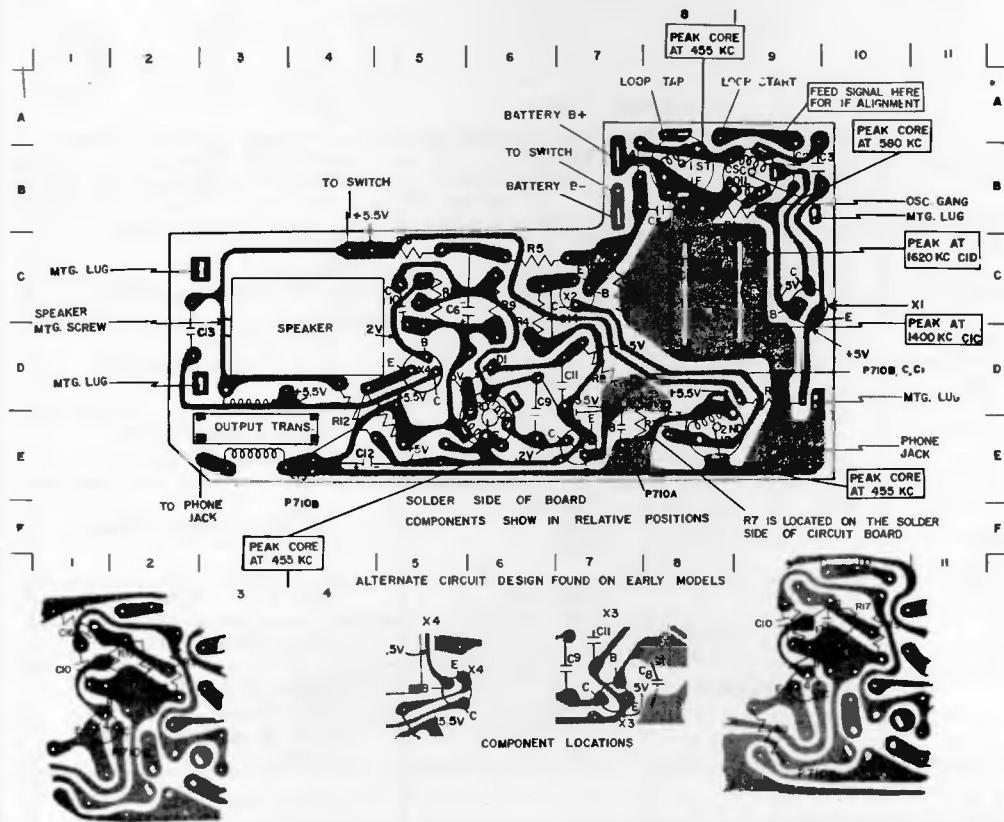

Feed the output from the signal generator to the junction of C2 and the loop antenna for IF alignment. For oscillator and antenna peaking, radiate a signal to the receiver by connecting a ferrite-rod antenna to the signal generator output leads.

All alignment points can be adjusted with the cabinet back off. The I.F. and oscillator cores can be peaked by using the holes provided in the circuit board.

Keep RF from signal generator low.

It is advisable to check battery voltage before alignment to insure a proper operating voltage. Always align the receiver with the batteries in place, as their close proximity to the loop antenna maintains the inductance constant for maximum operating efficiency.

1. Align all IF cores in T1, T2 and T3.
  2. With gang fully open align oscillator trimmer CID to peak at 1620 KC.
  3. Peak antenna trimmer C1C to maximum output at 1400 KC.
  4. Rock oscillator core and gang to peak at 580 KC.
- Repeat steps 2, 3 and 4 as necessary.

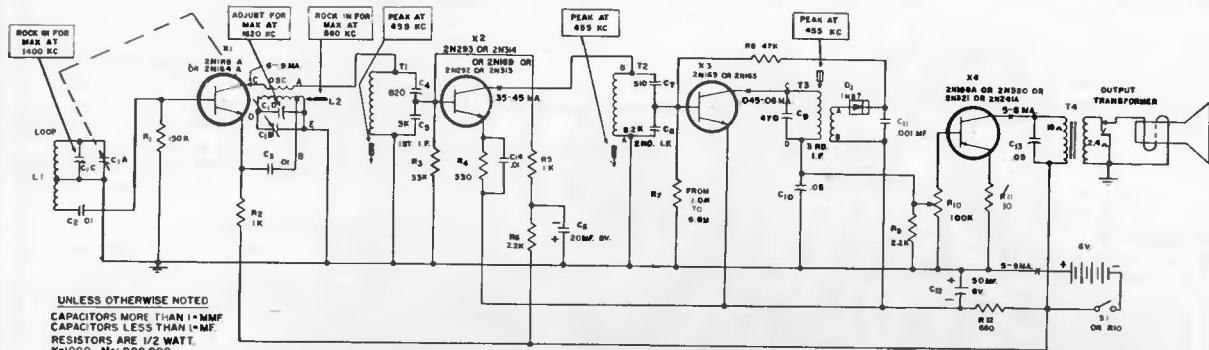

#### TRANSISTOR REPLACEMENT

To replace X4, remove the speaker as described above.

To remove X2, use needle nose pliers through the hole near the volume control.

# GENERAL ELECTRIC

Models P725 and P726

## CHASSIS REMOVAL

Remove both knobs. Remove the 4 batteries. Unsolder the two leads on the speaker; unscrew the 5 screws holding chassis to cabinet.

## GENERAL ELECTRIC

Models P745A, P746A

## TO REMOVE CIRCUIT BOARD

1. Remove cabinet back by twisting a coin in the two slots provided along bottom of the cabinet.
2. Remove the four screws that secure the circuit board to cabinet bosses. (SEE COMPONENT WIRING DIAGRAM FOR MOUNTING SCREW POSITIONS).
3. Remove the two screws that secure circuit board to speaker. (SEE COMPONENT WIRING DIAGRAM FOR MOUNTING SCREW POSITIONS).
4. Swing circuit board out of cabinet front. Leave all connecting leads attached to volume control and tuning capacitor.

## TO REMOVE TUNING CAPACITOR

1. Follow steps 1 and 2 as above.
2. Remove tuning knob by unscrewing the thumbscrew in its center in a counterclockwise direction.
3. Remove the flat head screws located under tuning knob.

## TO REMOVE VOLUME CONTROL

1. Follow steps 1 through 3 as above.
2. Remove on-off volume knob by unscrewing the screw in the center of the knob.
3. Remove hex nut from volume control shaft.
4. Move tuning capacitor slightly and lift out volume control.

## TROUBLESHOOTING

A check of the battery condition and total current drain of the receiver should be made first. All current measurements are made at quiescence with the receiver turned on, volume control at maximum, tuning gang closed, and with no signal conditions.

## CAPACITORS

RS-1378	CA,B,C,D	Tuning Capacitor.....
RS-1022	C1, 3	.01mf., 450V.....
	C2, 7	.01mf., 50V.
	C4	150mmf., 300V.
RS-1462	C5	8mf., 6V.
	C6, 9	390mmf., 300V.
RS-1024	C10,17,19	.05mf., 50V.....
	C18	.003mf., 100V
RS-1463	C16	32mf., 6V. ....
RS-1460	C11,12,14,15	3mf., 6V. ....

The total receiver current drain is 15 to 20 mils. This is measured by inserting a milliammeter in series with the batteries.

If an excessive total current drain is recorded, the individual collector current readings of each transistor should be checked. An excessive current reading may mean a shorted transistor; no current will indicate that a transistor or associated circuit components are defective.

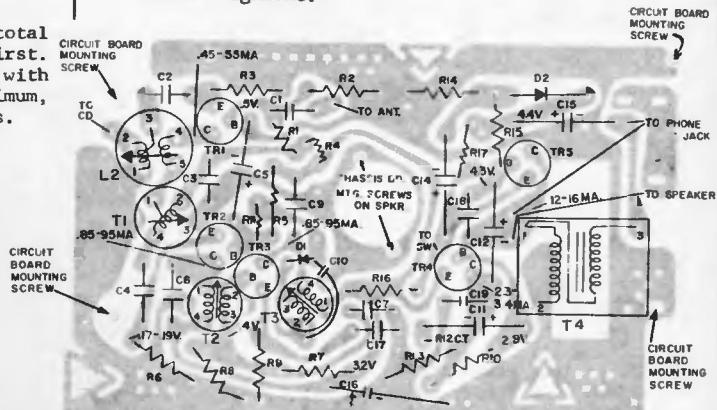

A single-edge razor blade is a satisfactory tool for cutting the copper circuit wiring, so that a milliammeter can be inserted in series with the break to measure the current flow. After each current check is completed, solder the cut carefully to complete the circuit again.

## NO RECEPTION:

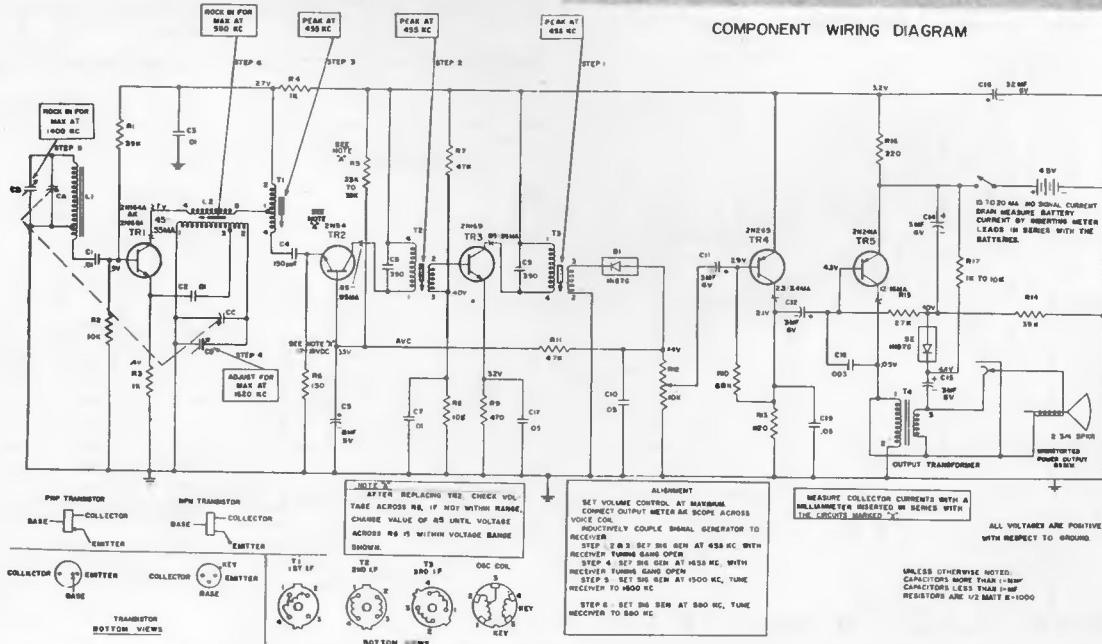

1. Check battery voltage and battery contacts.
2. Check on-off switch.
3. Check all antenna lead connections.
4. Check coil L2.

## WEAK AUDIO:

1. Check battery voltage for 4.5 volts.
2. Check battery current.
3. Check transistor collector currents.
4. Check alignment.

## TROUBLE SHOOTING HINTS

Total battery drain used by the receiver will give an indication of whether the transistors are operating normally. This current check is made at quiescence. This means the volume control should be all the way open, the tuning gang all the way closed, and with no signal or noise being picked up.

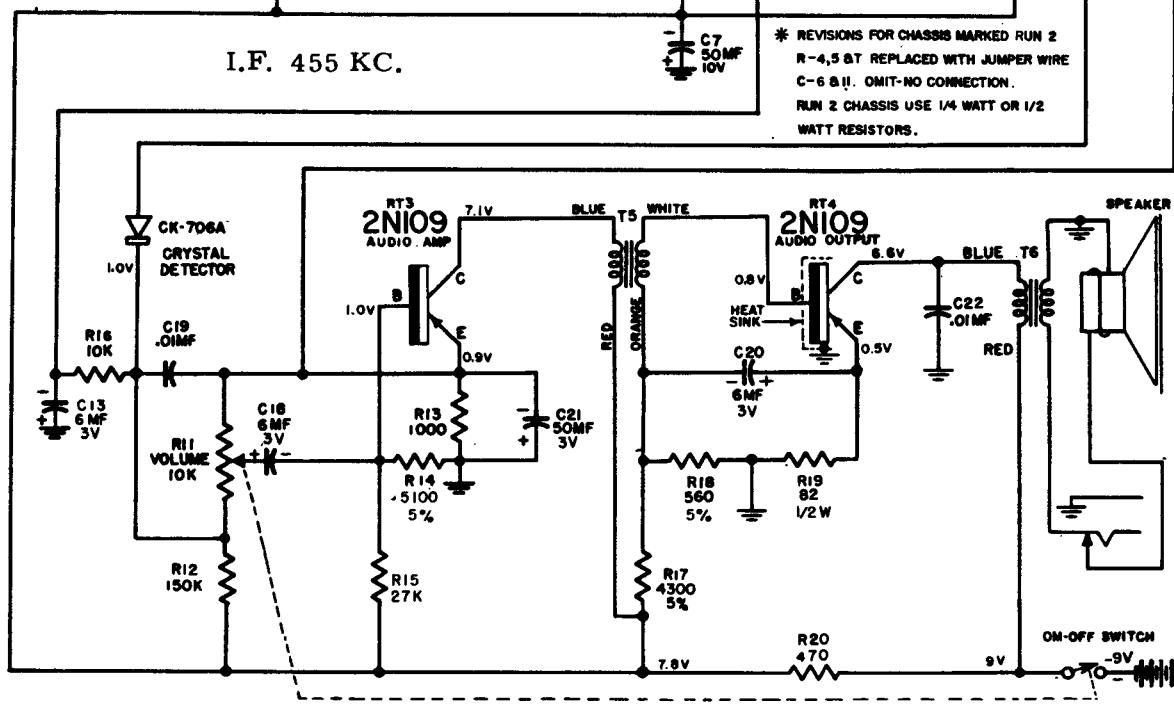

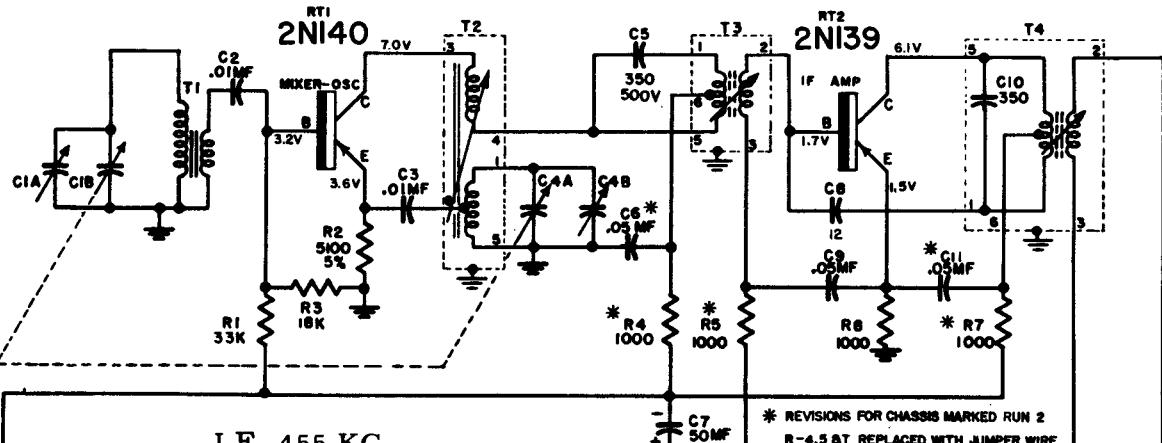

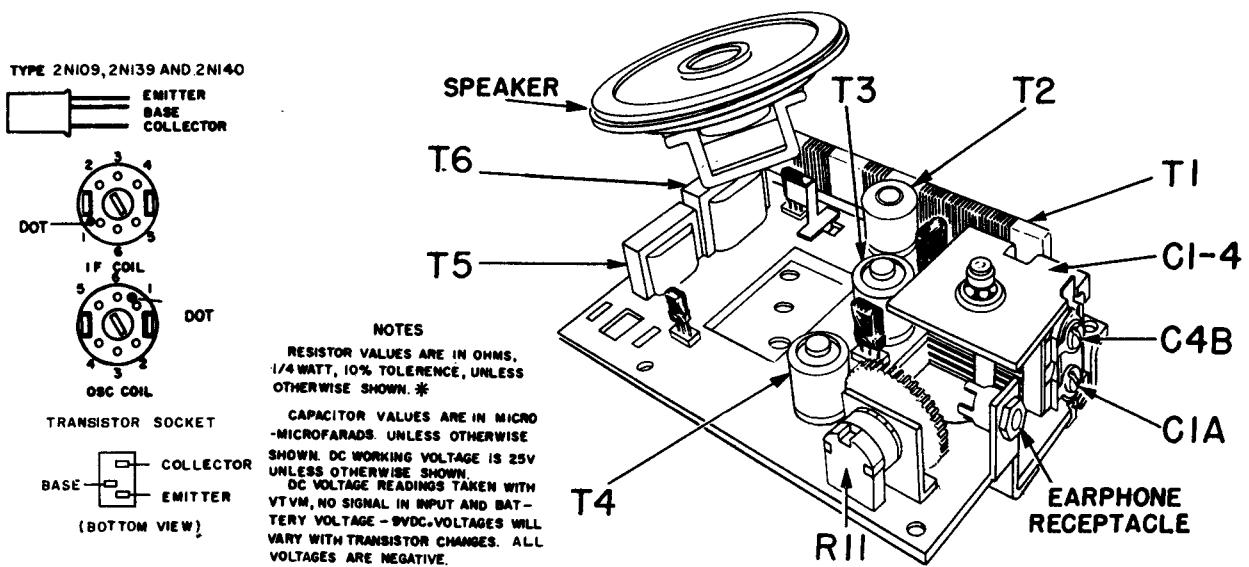

With the radio controls set according to the current flow check between the battery end cap and the negative end of the battery should indicate properly operating transistors. If excessive total current is noted when this check is made, individual current checks should be made at the collector section of the suspected transistors.

We are including in the schematic of this radio the proper current ranges found at the various check points. A properly operating stage should not vary from these readings. An excessive current reading will likely mean a shorted transistor.

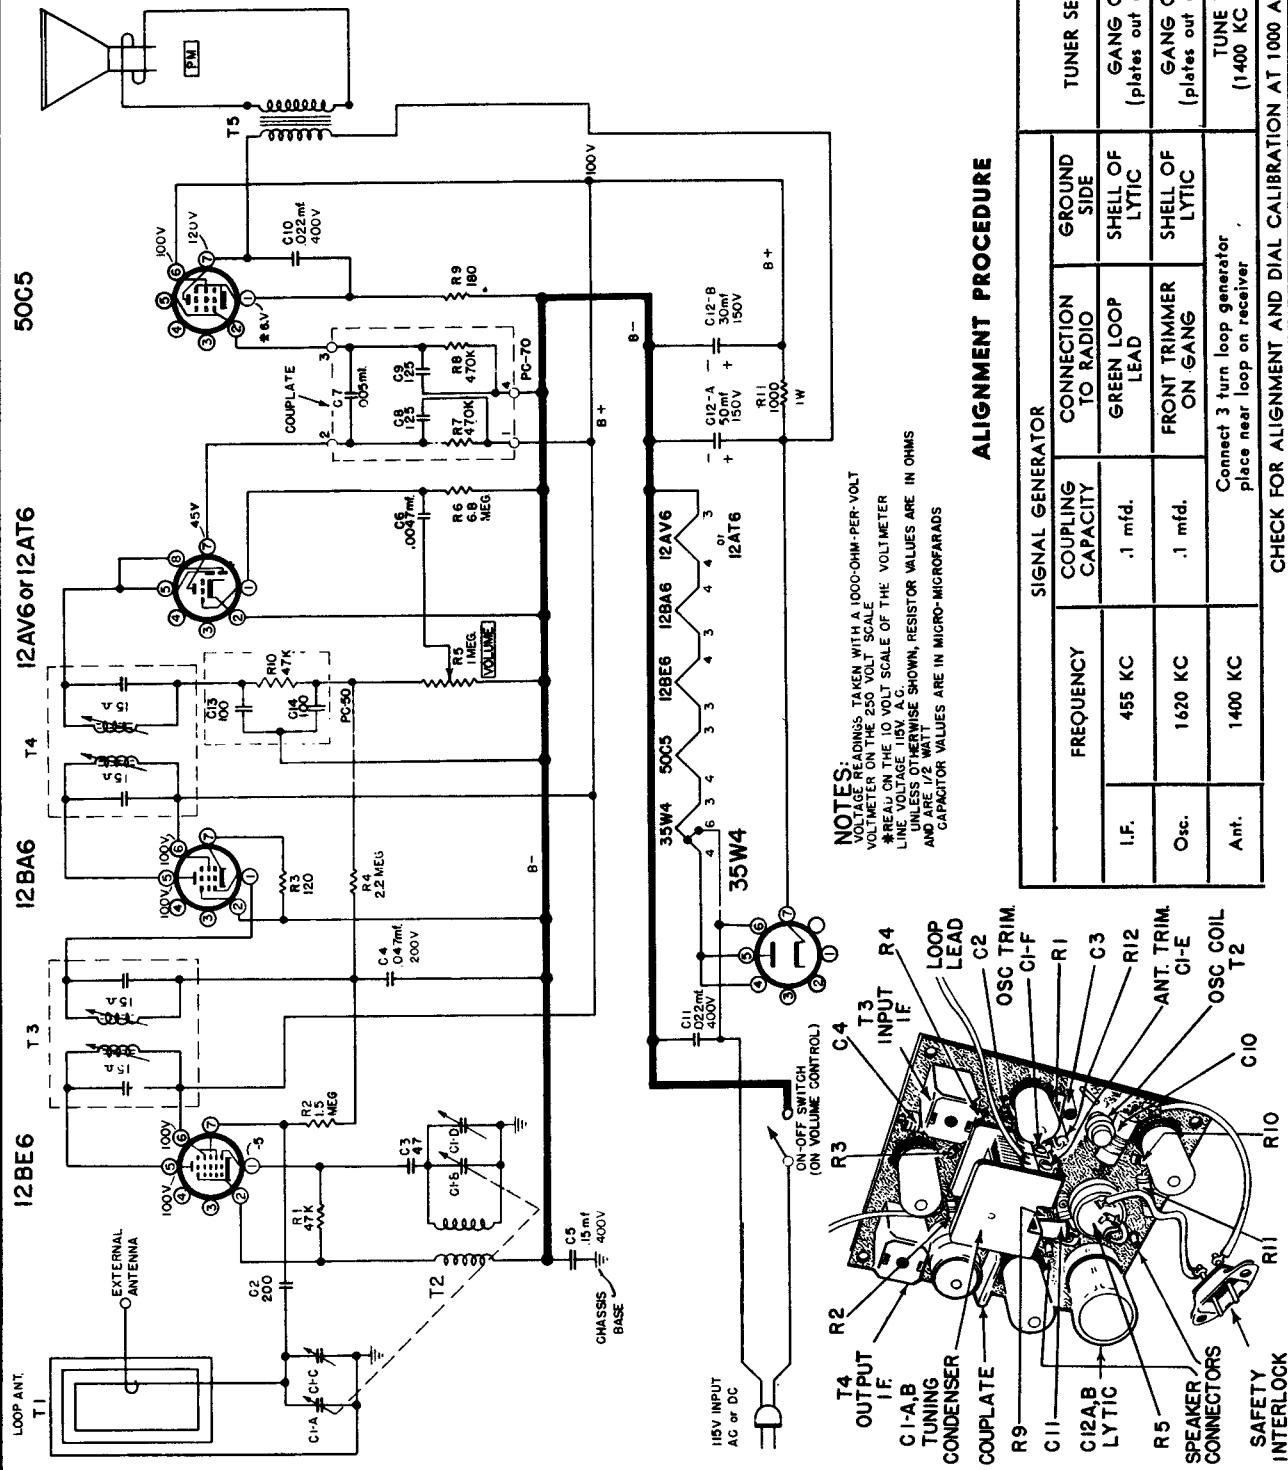

## TO REMOVE CHASSIS FROM CASE

1. Remove the end cap on the speaker end of the radio the same as you would to change the batteries.
2. Do not unsolder the wire attached to the end cap, but unsolder the wire from the chassis bracket to the case.
3. With a pair of longnose pliers, straighten the metal tab holding the speaker grille in place.
4. Remove the speaker grille by folding it up and toward the opposite end of the case.
5. Using care, pull out the speaker and unsolder the two leads.
6. Take out the screw near the tuning shaft hole, also the screw on the end cap tuning dial end.

EMITTER CURRENT ADJUSTMENT - NOTE: Allow 15 minutes warm-up time before making any adjustments. The emitter current is adjusted by variable resistor R-23 for a 500 Ma flow through the transistor with 14 volts at the receiver's "A" lead. Disconnect yellow lead which goes to the emitter contact of the transistor socket; connect this lead to the positive side of a milliammeter; connect negative side of meter to emitter contact of the transistor socket. Adjust variable resistor R-23 for a 500 Ma current flow through the meter. NOTE: INTERNAL RESISTANCE OF MILLIAMMETER SHOULD NOT EXCEED .5 OHM.

ALIGNMENT ADJUSTMENTS & PARTS LOCATIONS

**MOTOROLA**AUTO RADIO  
MODEL  
OE-A7X

**EMITTER CURRENT ADJUSTMENT - NOTE:** The emitter current is adjusted by variable resistor R-22 for a 500 Ma. flow through the transistor with 14 volts at the receiver's "A" lead. Disconnect yellow lead which goes to the emitter contact of the transistor socket; connect it to the positive (+) side of a milliammeter; connect negative (-) side of meter to emitter contact of the transistor socket. Adjust R-22 for a 500 Ma current flow through the meter. NOTE: INTERNAL RESISTANCE OF MILLIAMMETER SHOULD NOT EXCEED .5 OHM.

**TO SET PUSHBUTTONS**

To set the pushbuttons for automatic tuning, proceed as follows:

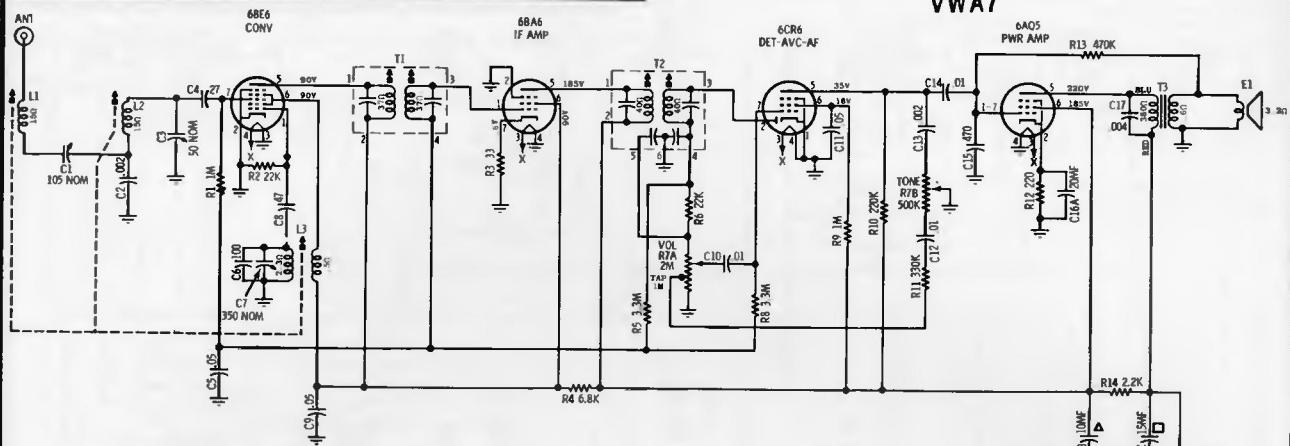

- ⑥ RF TRIM 1610 KC
- ⑤ OSC TRIM 1610 KC
- ⑦ ANT TRIM 1610 KC

- TOP ④ ③ BOT 2ND IF 262.5 KC
- TOP ② ① BOT 1ST IF 262.5 KC

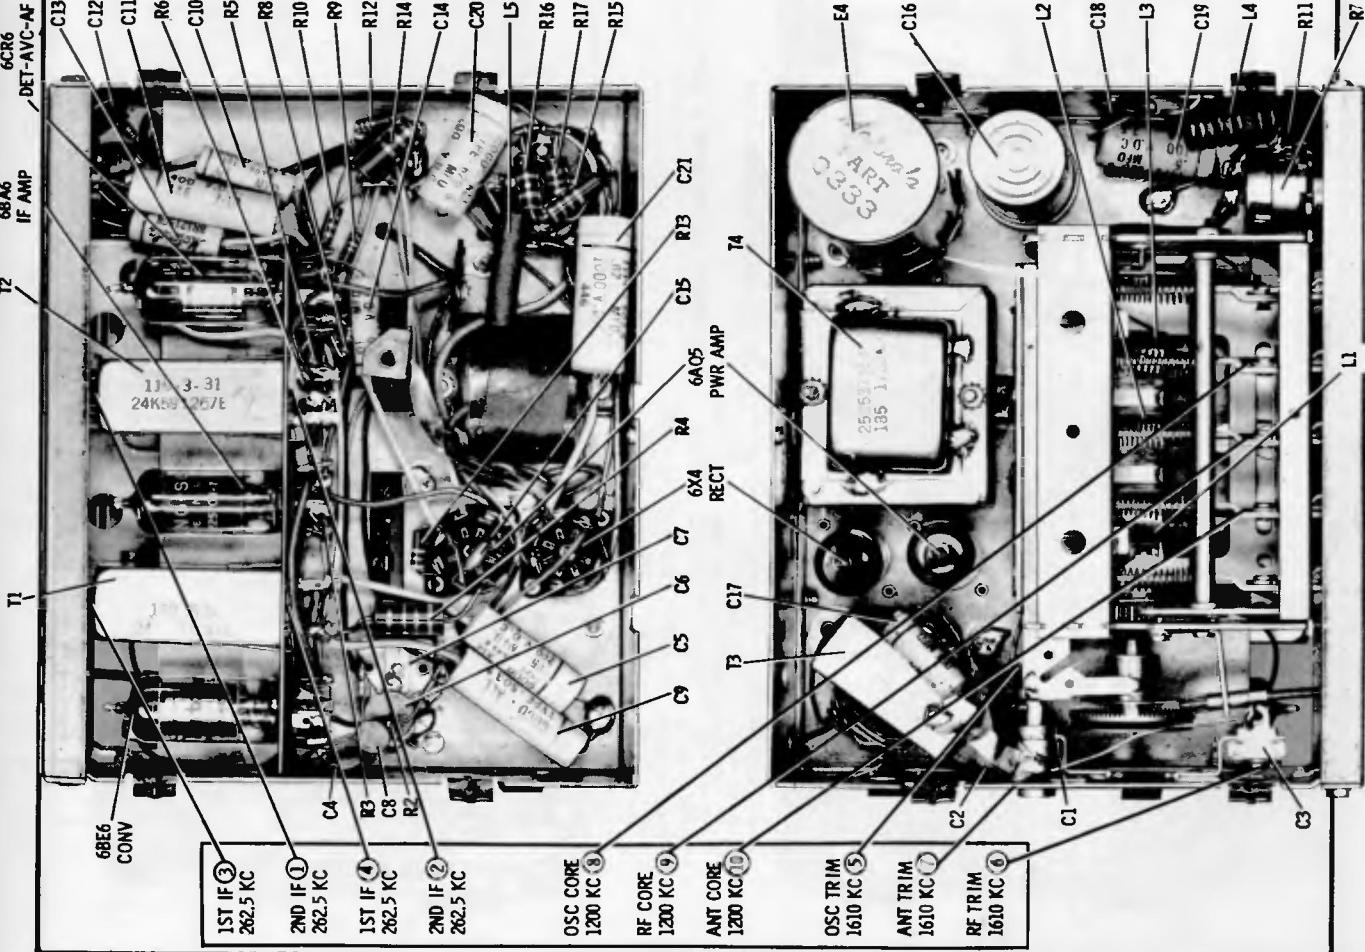

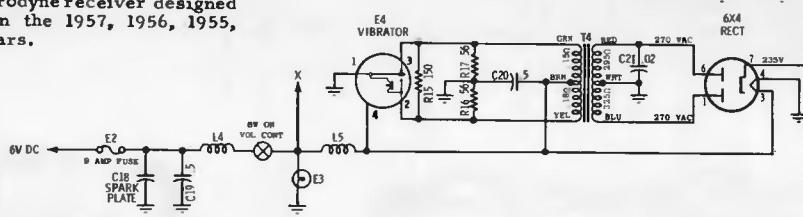

ALIGNMENT LOCATIONS

1. Tune in the desired station with the manual tuning knob. Tune carefully until you are exactly on the station.
2. Pull out the first pushbutton to be set, to unlock the button for station set-up, and then push button in firmly to set and lock the pushbutton.
3. Follow the above procedure for the remaining four push-buttons.

AUTO RADIO

MODEL  
8MX

1. Thread a sufficient length of dial cord through two holes in shaft.
2. Wind 4 turns from each hole toward center of shaft as shown in detail.
3. Thread over guides and tie knot as shown.

**CAUTION**

"A" LEAD MUST BE CONNECTED TO POSITIVE (+) SIDE OF POWER'S SUPPLY. RADIO WILL NOT OPERATE AND DAMAGE TO COMPONENTS WILL RESULT IF CONNECTED OTHERWISE.

- c. Adjust R-19 for a collector current reading of 360 ma with 12.6 volts input to radio "A" lead.

NOTE: Two values of radio input voltage are given as a convenience to service personnel to accommodate different power sources. The schematic collector current value of 440 ma is stated with 14 volts DC input to receiver "A" lead.

**TRANSISTOR INSULATOR** - When replacing a transistor or transistor insulator, be sure to coat both sides of insulator with DC-4 Grease (Motorola Part No. 11M490487) to insure proper heat dissipation.

**TRANSISTOR CHECK** - Substituting a known good transistor for a suspected one is the simplest and most positive method of checking transistors. NOTE: When checking, be sure transistor insulator is in place (see SERVICE NOTE 6).

**TUBE CHECK** - Substituting a known good tube for a suspected one is the best and only check recommended at this time.

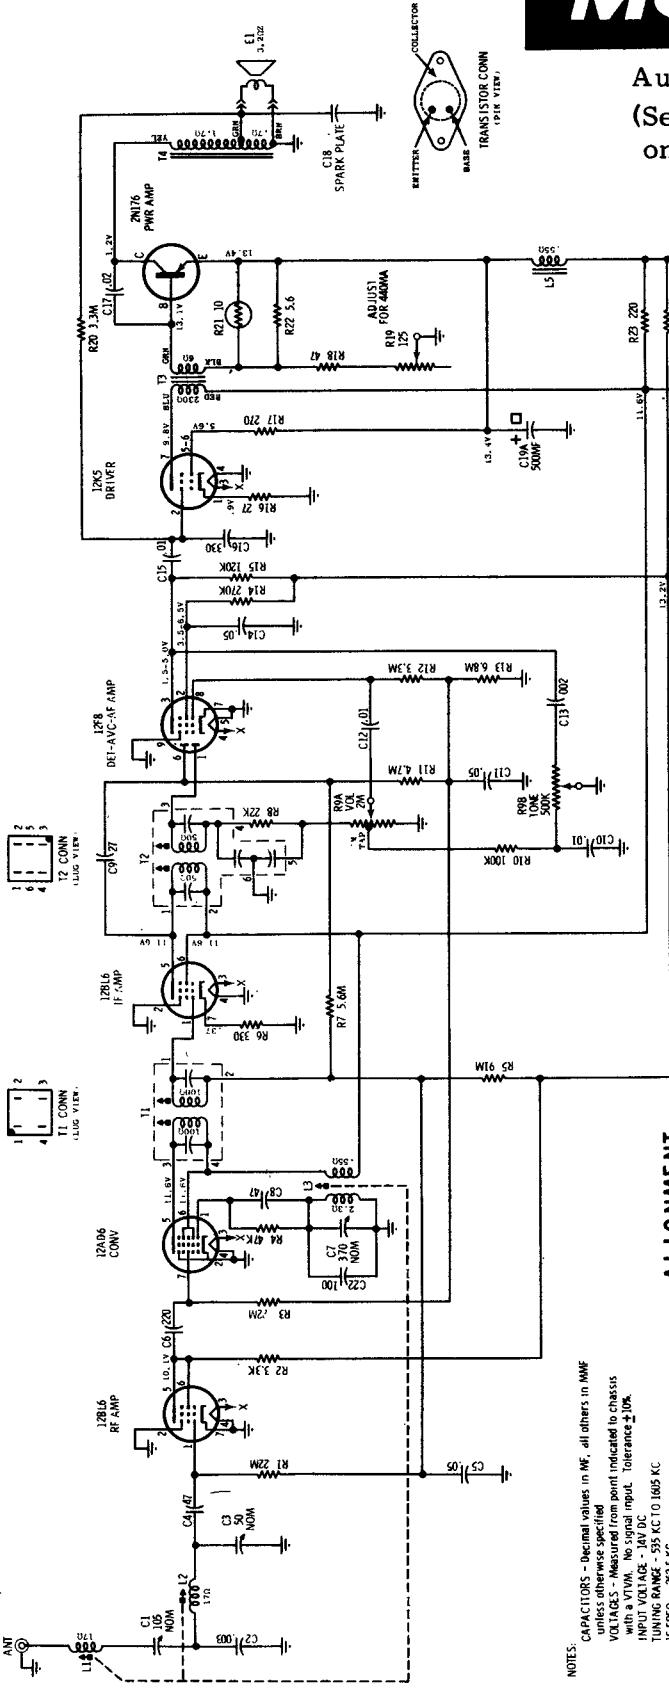

**SERVICE NOTES**

**TRANSISTOR CURRENT ADJUSTMENT** - After the transistor has been replaced, the collector current should be checked and adjusted for proper operation.

- a. Set R-19 on back of receiver to its maximum resistance position (fully clockwise) to avoid excessive collector current, then allow radio to warm-up for 15 minutes.
- b. Open the output transformer T4 (speaker connected) by disconnecting the collector lead (Yel.) from the center lug of transistor socket, and insert a 0-1 amp DC Ammeter whose internal resistance is .05 ohms or less: (+) side of meter to lug of transistor socket and (-) side to yellow lead of transformer.

**SERVICE NOTES**

1. **RADIO POLARITY** - WHEN SERVICING THIS RECEIVER ON THE SERVICE BENCH, BE SURE THAT THE RECEIVER "A" LEAD IS CONNECTED TO THE POSITIVE SIDE OF THE POWER SOURCE AND THAT THE RECEIVER HOUSING IS CONNECTED TO THE NEGATIVE SIDE. IF CONNECTED OTHERWISE, THE RECEIVER WILL NOT OPERATE AND DAMAGE TO COMPONENTS MAY RESULT.

2. **POWER SUPPLY REQUIREMENTS** - It is preferable to use a storage battery (without a battery charger) in place of a battery eliminator when servicing this receiver, because the average eliminator has an extremely high AC ripple content which may damage the transistor and other low voltage components. The average output of the eliminator may be read as 14 volts, but the peak ripple may actually be 15 to 25 volts or higher. Only a well filtered and regulated eliminator type power supply should be used to service this receiver in place of the storage battery recommended.

3. **SERVICING PRECAUTION** - When servicing this receiver, probing with a screwdriver (checking for spark to ground from various points) must be avoided, because the plate power is obtained directly from the storage battery and high currents can flow through the components causing permanent damage. The transistor stage is especially susceptible to damage from this type of check. If the transistor BASE electrode is shorted to ground (either directly or through any other path) the BASE bias will be removed allowing excessive current to flow through the transistor causing permanent damage by melting the indium junctions in the transistor.

4. **TRANSISTOR REPLACEMENT** - When replacing a transis-

CAUTION

"A" LEAD MUST BE CONNECTED TO POSITIVE (+) SIDE OF POWER SUPPLY. RADIO WILL NOT OPERATE AND DAMAGE TO COMPONENTS WILL RESULT IF CONNECTED OTHERWISE.

"A" LEAD MUST BE CONNECTED TO POSITIVE (+) SIDE OF POWER SUPPLY. RADIO WILL NOT OPERATE AND DAMAGE TO COMPONENTS WILL RESULT IF CONNECTED OTHERWISE.

5. **TRANSISTOR CURRENT ADJUSTMENT** - After replacing transistor and before connecting radio to power supply, set the transistor bias control (R-13) to the maximum (fully counterclockwise) position to prevent excessive current from damaging the transistor. Allow about 15 minutes warm-up time before proceeding with the following:

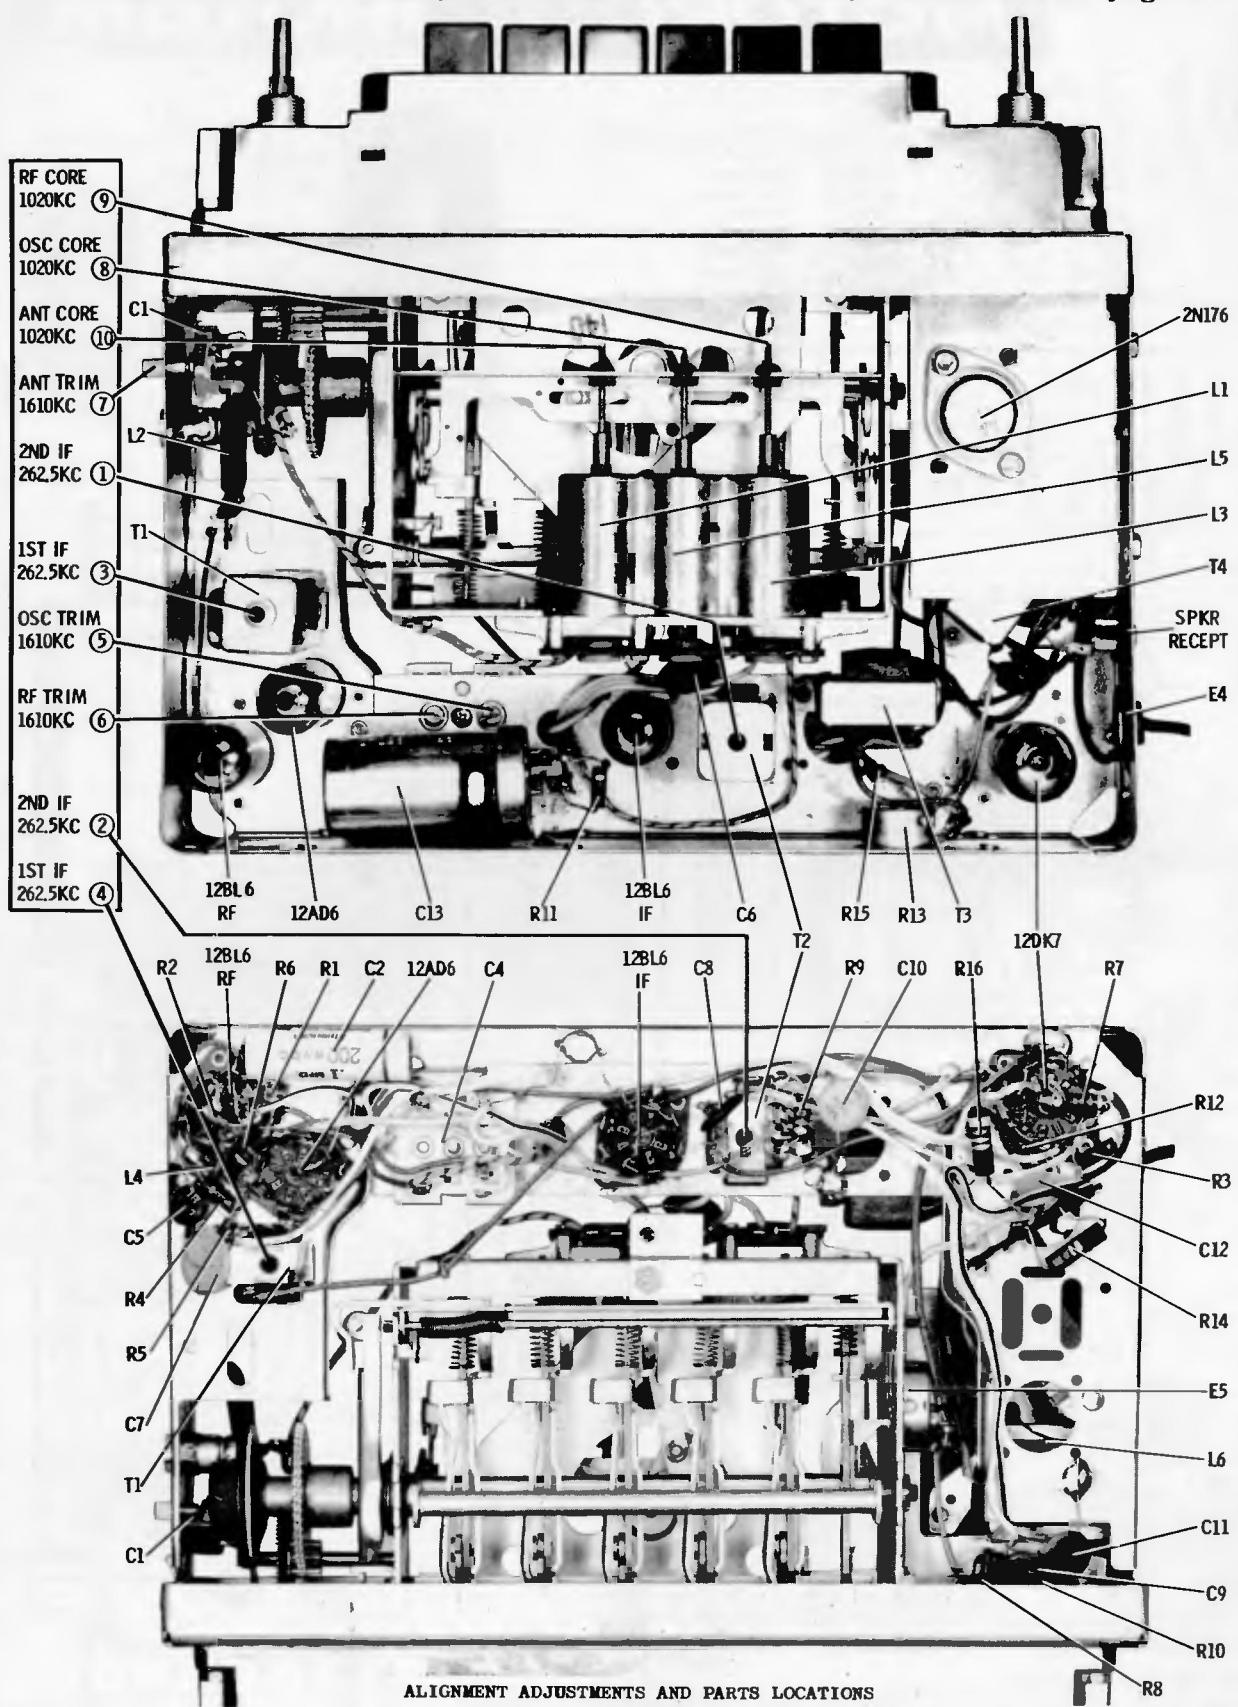

- Connect a VTVM from transistor collector electrode (external shell) to chassis.
- Adjust R-13 for .98 volts on VTVM. (This corresponds to a collector current of 420 MA).
- Repeat Step b after a half hour.

6. **TRANSISTOR INSULATOR** - When replacing a transistor or transistor insulator, be sure to coat both sides of insulator with DC-4 grease (Motorola Part No. 11M490487) to insure proper heat dissipation.

7. **TRANSISTOR CHECK** - Substituting a known good transistor for a suspected one is the simplest and most positive method of checking transistors.

**398X**

(Continued on page 99)

**ALIGNMENT**

Connect an output meter across the speaker voice coil. Set volume to maximum. Attenuate generator output to maintain 1.79 volts on output meter at all times to prevent overloading the receiver.

STEP	GENERATOR CONNECTION	GENERATOR FREQUENCY (400 cycle mod)	TUNER SET TO	ADJUST	REMARKS
1.	Conv grid (pin 7) thru 1 mfd capacitor and chassis	262.5 Kc	Hi end stop	1, 2, 3 & 4	Peak for maximum.
2.	Ant receipt through dummy (see Fig.)	1610 Kc	Hi end stop	5, 6 & 7	Peak for maximum.
3.	Ant receipt through dummy (see Fig.)	1610 Kc	Hi end stop	5, 6 & 7	Peak for maximum.
4.	"	1400 Kc	13/64" from hi end stop	8, 9 & 10	Peak for maximum.
5.	"	1610 Kc	Hi end stop	5, 6 & 7	Peak for maximum.
6.	Repeat steps 4 and 5 until no further increase, then cement tuning cores in place.	-	Weak station around 1400 Kc	7	With radio installed in car and antenna fully extended, peak antenna trimmer for maximum.
7.	ANTENNA TRIMMER	-	-	-	-

**TRANSISTOR REPLACEMENT** - When replacing a transistor, be sure that the transistor insulator is in place and that the mounting screws are securely tightened. If insulator is not in place the transistor will be shorted to chassis and set will not operate. If mounting screws are not tight, the transistor will be damaged due to lack of proper heat dissipation. NOTE: When a transistor is replaced the current should be checked (see SERVICE NOTE 5 and 6).

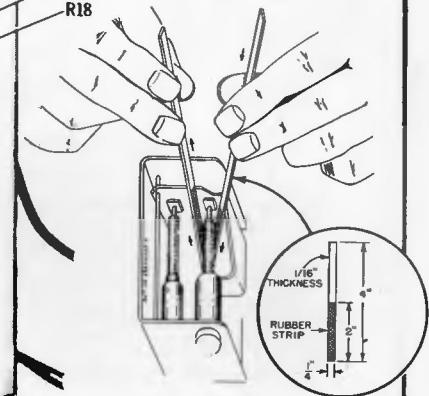

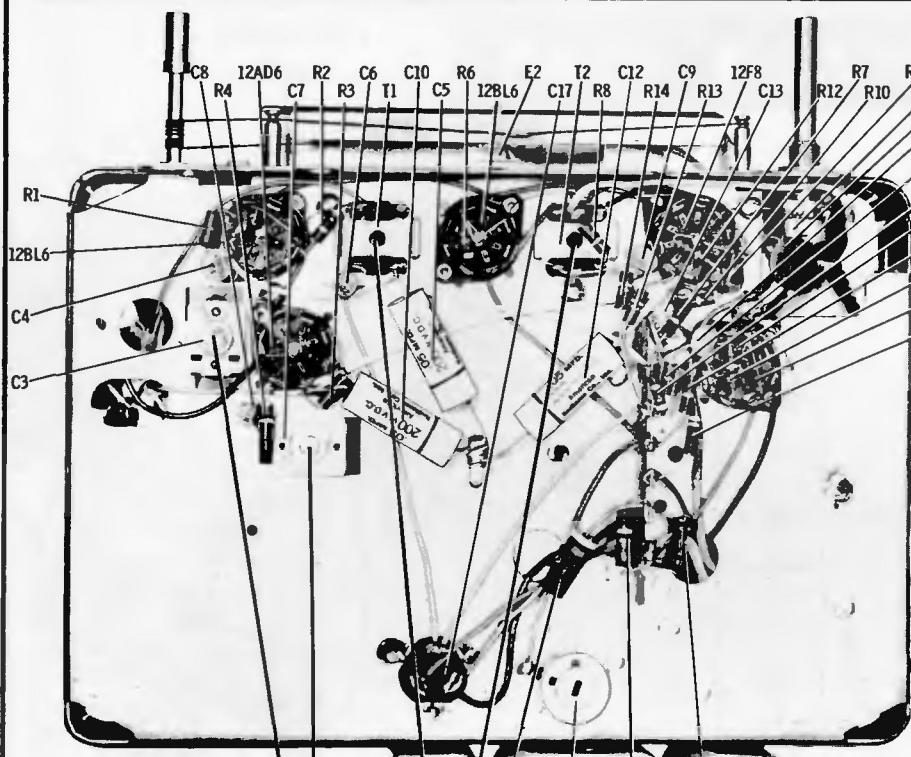

**TRANSISTOR CURRENT ADJUSTMENT** - After a transistor has been replaced, the collector current should be checked and adjusted for proper operation.

- Set R-19 to its maximum resistance position (fully counter-clockwise from wiring side) to avoid excessive collector current, then allow radio to warm-up for 15 minutes.
- Open the output transformer T-4 (speaker connected) by disconnecting the collector lead (Yel) from the center lug of transistor socket and insert an 0-1 amp DC Ammeter (.05 ohms internal resistance or less); (+) side of meter to lug of transistor socket and (-) to yellow lead of transformer.
- Adjust R-19 for a collector current reading of 360 ma. with 12.6 volts input to radio "A" lead.

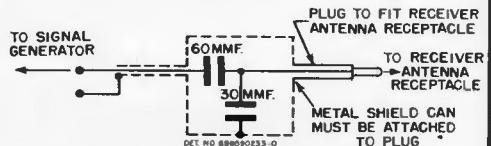

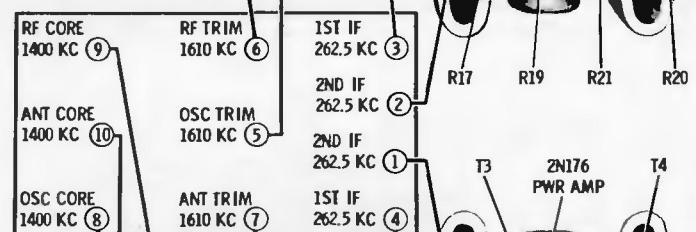

NOTE: Two values of radio input voltage are given as a convenience to service personnel to accommodate different power sources. The schematic collector current value of 440 ma. is stated with 14 volts DC input to receiver "A" lead.

# MOTOROLA

Circuit diagram is exact for Model 854. Models 852 and 853 are similar electrically to Model 854.

- Model 852, used in Dodge cars  
Model 853, used in DeSoto cars  
Model 854, used in Plymouth cars

Model 852      Dodge LD1, LD2, LD3  
Model 853      DeSoto LS1, LS2, LS3  
Model 854      Plymouth LP1, LP2

- MODEL 854 SCHEMATIC DIAGRAM**
- Connect a VTVM from collector electrode (transistor shell) to chassis.
  - Adjust R-14 for .85 volts on VTVM. (This corresponds to a collector current of 425 Ma.)
  - Repeat step b after a half-hour.

**TRANSISTOR INSULATOR** - When replacing a transistor or transistor insulator, be sure to coat both sides of insulator with DC-4 grease (Motorola Part No. 11M490487) to insure proper heat dissipation.

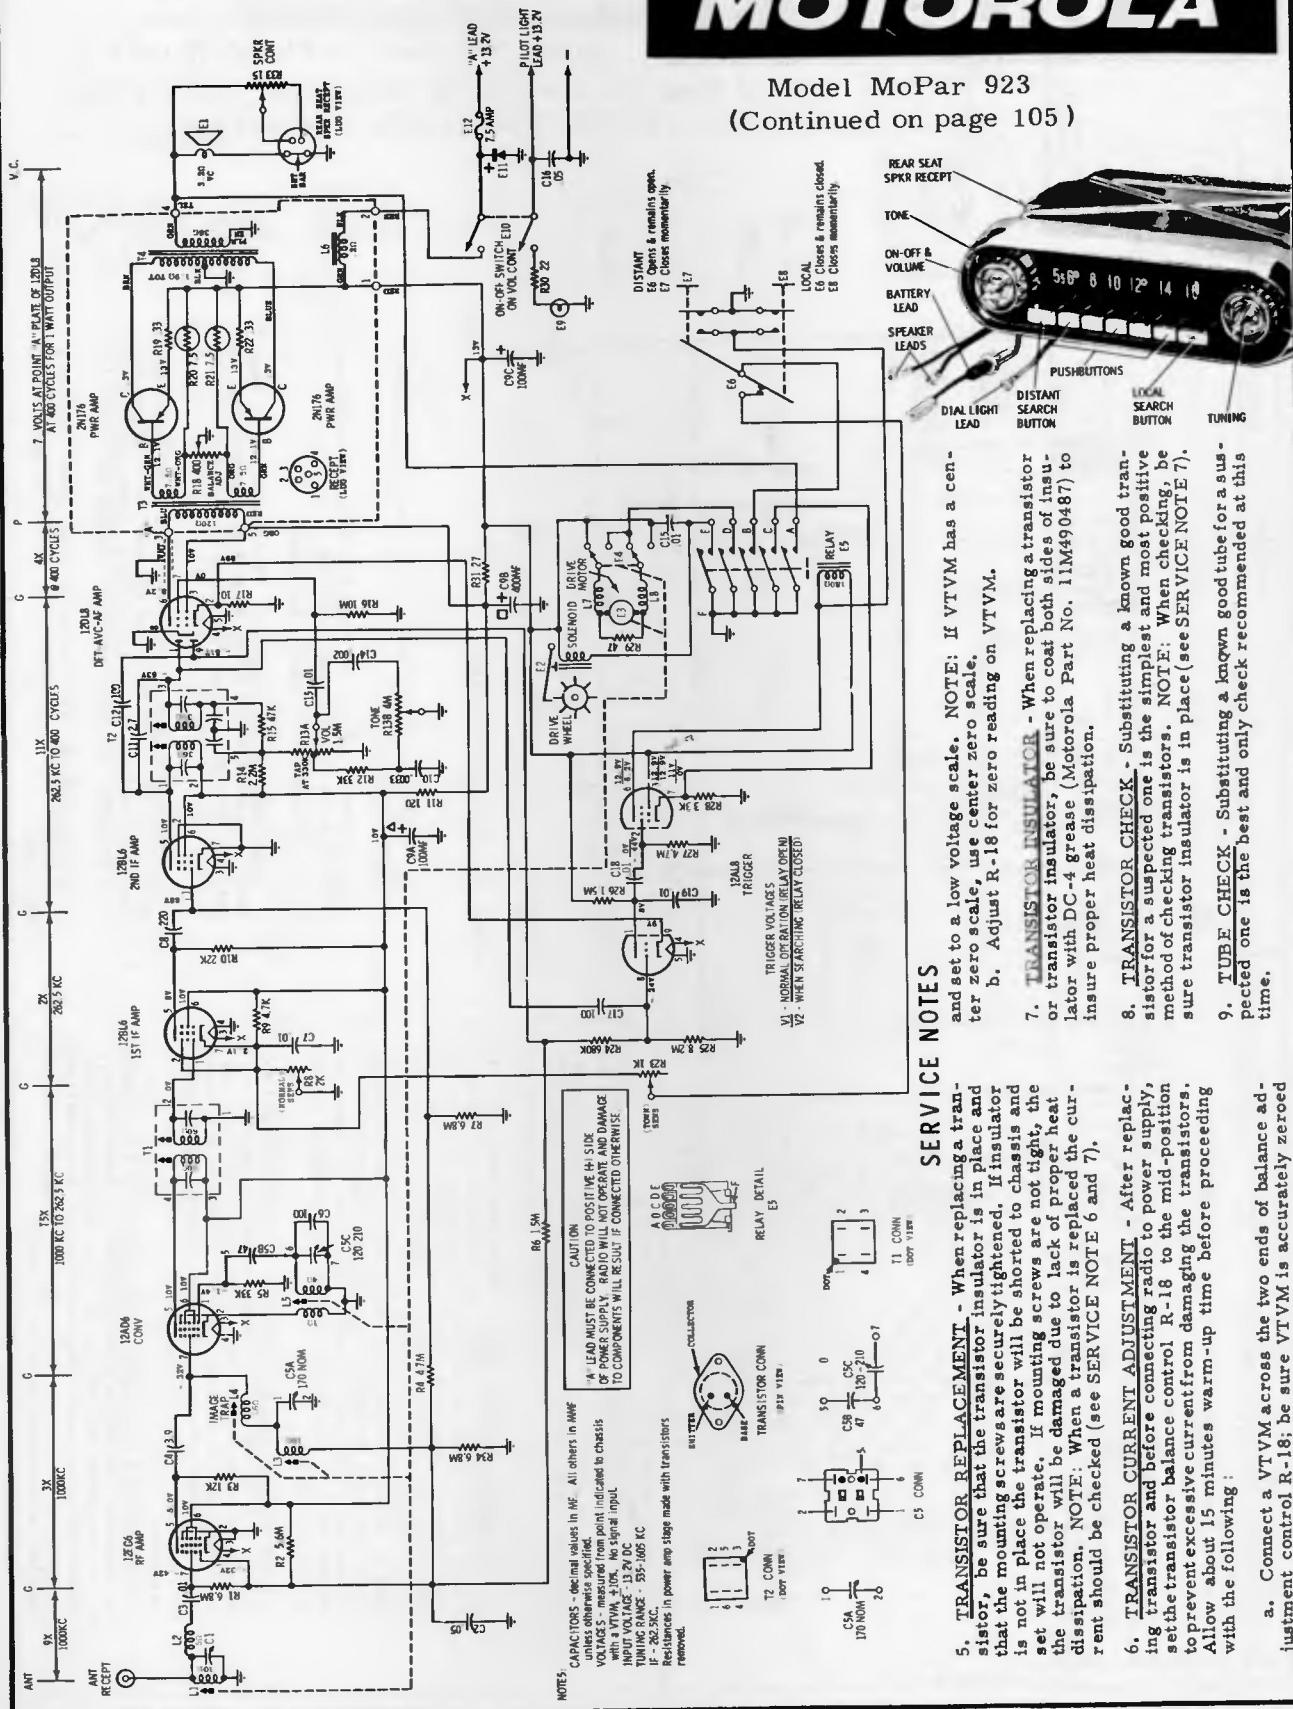

**TRANSISTOR CHECK** - Substituting a known good transistor for a suspected one is the simplest and most positive method of checking transistors. NOTE: When checking, be sure transistor insulator is in place (see SERVICE NOTE 6).

**TUBE CHECK** - Substituting a known good tube for a suspected one is the best and only check recommended at this time.

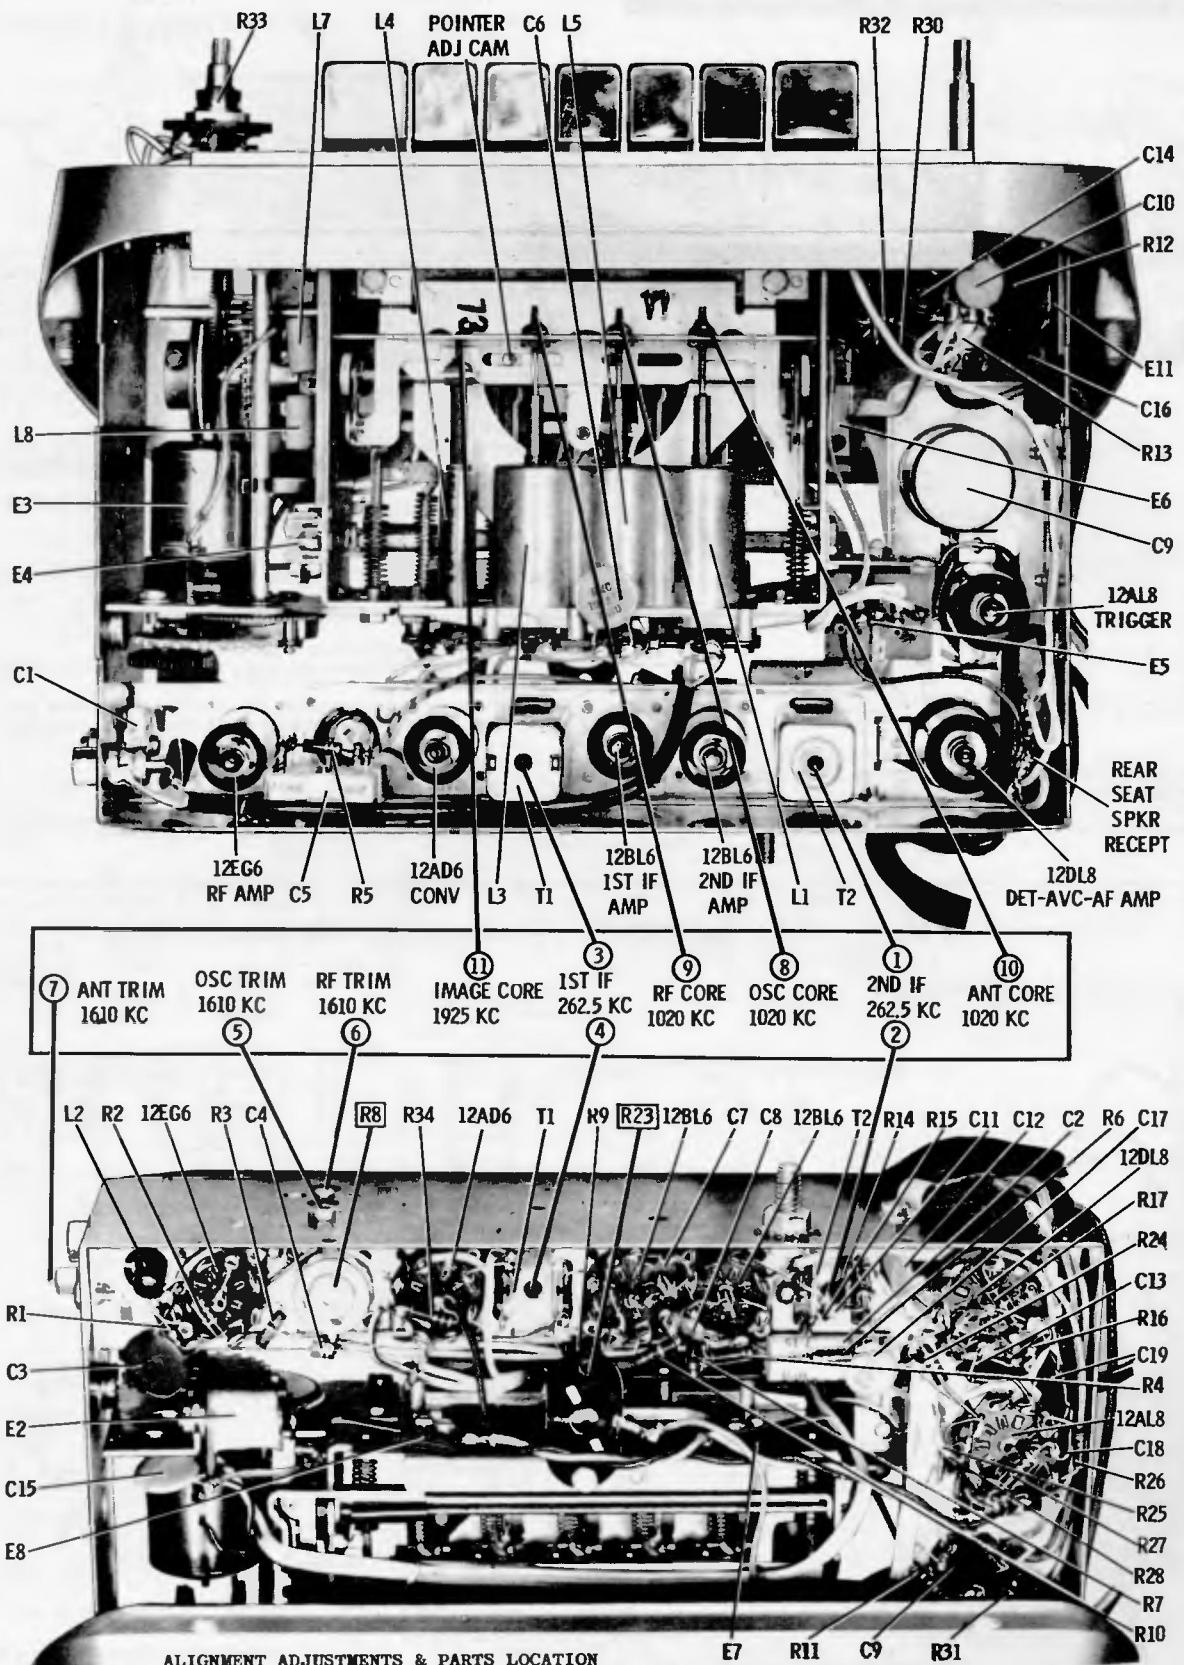

**SERVICING PRECAUTION** - When servicing this receiver, probing with a screwdriver (checking for spark to ground from various points) must be avoided, because the plate power is obtained directly from the storage battery and high currents can flow through the components causing permanent damage. The transistor stage is especially susceptible to damage from this type of check. If the transistor BASE electrode is shorted to ground (either directly or through any other path) the BASE bias will be removed allowing excessive current to flow through the transistor causing permanent damage.

**TRANSISTOR REPLACEMENT** - When replacing a transistor, be sure that the transistor insulator is in place and that the mounting screws are securely tightened. If insulator is not in place the transistor will be shorted to chassis and set will not operate. If mounting screws are not tight, the transistor will be damaged due to a lack of proper heat dissipation.

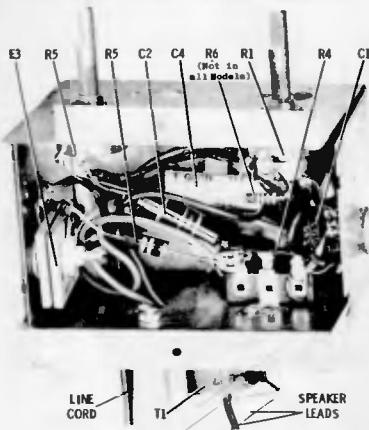

**TRANSISTOR CURRENT ADJUSTMENT** - After replacing transistor and before connecting radio to power supply, set the transistor bias control (R-14) to the maximum (fully counter-clockwise) position to prevent excessive current from damaging the transistor. Allow about 15 minutes warm-up time before proceeding with the following:

## SPEAKER PHASING

NOTE: THE SPEAKERS MUST BE PHASED OR A LOSS OF THE LOW FREQUENCIES WILL RESULT

Phasing can be checked by momentarily connecting a 1-1/2 volt flashlight cell in parallel with the output transformer secondary and noting that the cones of all speakers move in the same direction. If they do not, reverse the connections of one speaker.

CHASSIS

Capacitors - decimal values in MF all others in MMF unless otherwise specified.

Voltages - measured from point indicated to B- with a VTVM.

## DISASSEMBLY INSTRUCTIONS

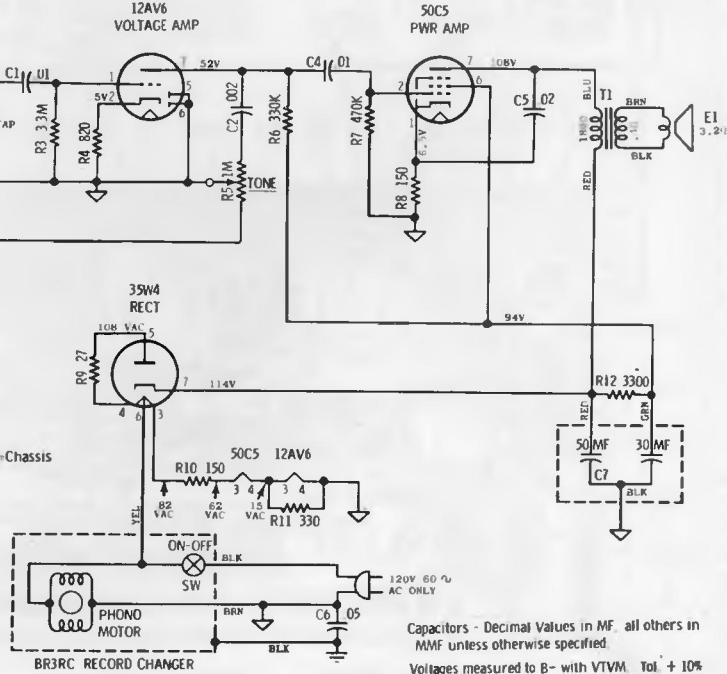

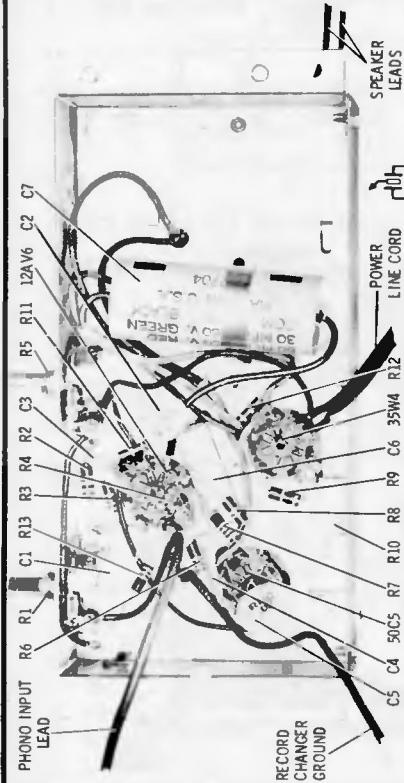

To Remove Chassis from Cabinet

1. Pull off two knobs from front of cabinet.
2. Remove four (4) phono mounting board and two (2) baffle retainer screws.
3. Lift rear of phono mounting board slightly and slide out.
4. Remove two screws which hold chassis to mounting board and remove chassis.

To Remove Turntable

1. Remove "C" washer from spindle.
2. Remove turntable by pulling up - off of spindle.

## CHASSIS

1. Pull the volume control knob from front of radio.
2. Remove tuning knob retaining screw from the tuning knob and remove the tuning knob (see cover photo).
3. Remove chassis mounting screw from under tuning knob (see cover photo).
4. Open rear cover and turn handle perpendicular to the plated chassis.
5. Grasp handle near one of its two mounting bushings and pull out from side of cabinet until the round portion of the mounting bushing clears hole in side of cabinet, then lift this side of handle and chassis slightly out of cabinet. Perform the same procedure on the other mounting bushing, then lift handle, chassis and speaker plate out of cabinet.
6. The plated chassis is separated from the speaker mounting plate as follows: unsolder the wire that connects from the gang to the plated chassis. Remove speaker, earphone jack, antenna & battery leads from plated chassis. Then unsolder one at a time the four chassis mounting support lugs.

#### CHASSIS REMOVAL

1. Pull the volume control knob from front of radio.
2. Remove tuning knob retaining screw from the tuning knob and remove the tuning knob.
3. Remove chassis mounting screw from under tuning knob.
4. Open rear cover and turn handle perpendicular to the plated chassis.
5. Grasp handle near one of its two mounting bushings and pull out from side of cabinet until the round portion of the mounting bushing clears hole in side of cabinet, then lift this side of handle and chassis slightly out of cabinet. Perform the same procedure on the other mounting bushing, then lift handle, chassis and speaker plate out of cabinet.
6. The plated chassis is separated from the speaker mounting plate as follows: unsolder the wire that connects from the gang to the plated chassis. Remove speaker, earphone jack, antenna & battery leads from plated chassis. Then unsolder one at a time the three chassis mounting support lugs.

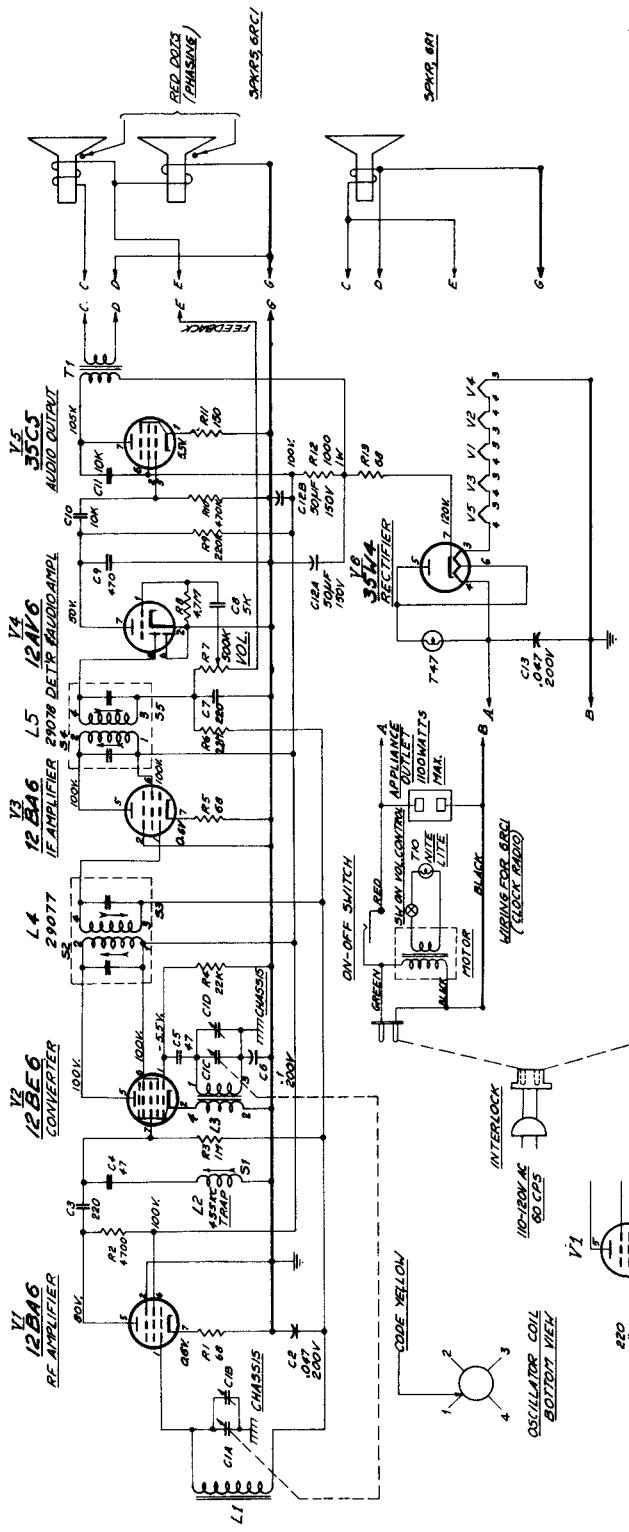

#### HANDLE REPLACEMENT

1. Remove chassis and speaker mounting plate from cabinet as described under CHASSIS REMOVAL.
2. Unsolder antenna leads from chassis.
3. Turn handle perpendicular to chassis and slide out of handle clips.

# Packard Bell

## TABLE MODEL RADIO 6R1 CLOCK RADIO MODEL 6RC1

**Schematic, 6R1 & 6RC1. Note differences in speaker section and AC power input section in the two circuits.**

### DC RESISTANCE MEASUREMENTS:

1st I-F Coil (29077):  
Primary, 12 ohms  
Secondary, 13 ohms

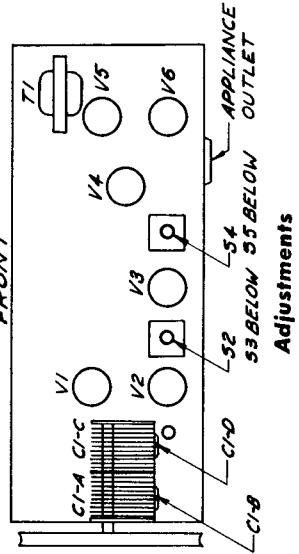

2nd I-F Coil (29078):  
Primary, 13 ohms  
Secondary, 13 ohms

Oscillator Coil (29229B)  
Primary, 1 ohm  
Secondary, 5.5 ohms

Loop antenna:  
Resistance, 0.3 ohms

### ALIGNMENT PROCEDURE:

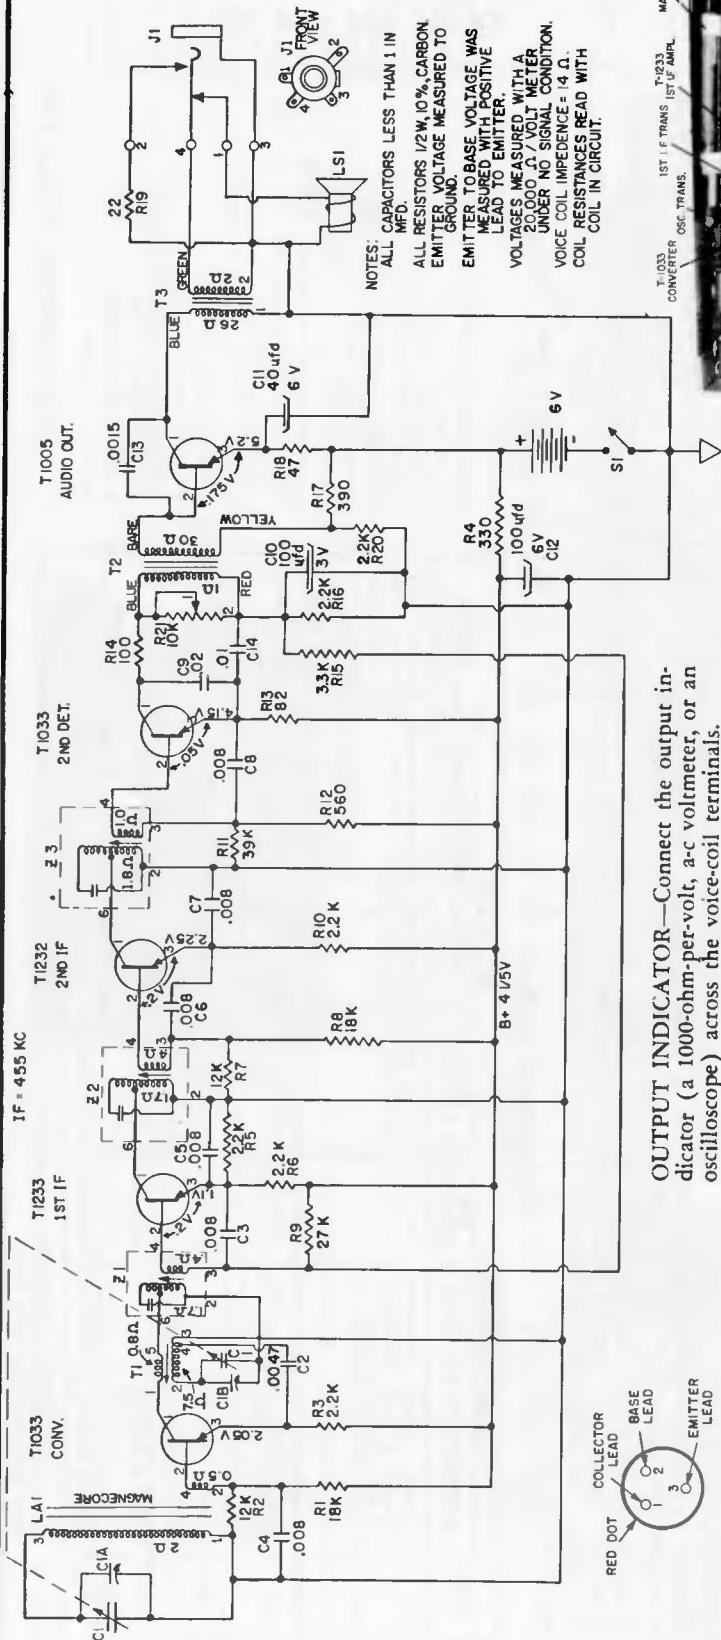

Step	Connect Test Oscillator to	Test Oscillator Frequency	Radio Dial Setting	Adjust
1.	Pin 1, V-1 (12BA6)	455 kc	540 kc	S-1 for minimum
2.	ditto	ditto	ditto	S-2, S-3, S-4, & S-5 for MAXIMUM
3.	ditto	1620 kc	Tune to	C1-D for MAXIMUM
4.	Loose-couple to antenna	1500 kc	1620 kc	C1-B for MAXIMUM oscillator

The alignment of the set is accomplished by following the steps in the chart below. Connect output meter to speaker voice coil.  
Each adjustment should be made using a minimum input signal. Connect test oscillator through a .01 mfd capacitor to the point indicated below. Ground lead of oscillator is connected to B minus bus.

## PHILCO TRANSISTOR RADIO

MODEL T-500 — CODE 124

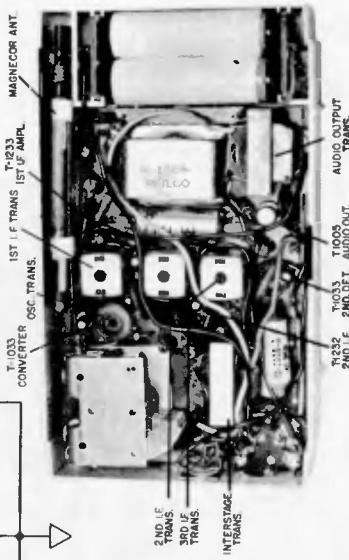

**OUTPUT INDICATOR**—Connect the output indicator (a 1000-ohm-per-volt, a-c voltmeter, or an oscilloscope) across the voice-coil terminals.

## ALIGNMENT CHART

STEP	SIGNAL GENERATOR CONNECTION TO RADIO	DIAL SETTING	SPECIAL INSTRUCTIONS	ADJUST		
				2ND IF TRANS.	3RD IF TRANS.	INTERSTAGE TRANS.
1	Panel must be removed from cabinet. Connect signal generator through a .1 uf condenser to antenna section of gang. Use the least generator signal necessary to give an output indication.	455 KC	Tuning gang fully open.	Z3—3rd IF	Z2—2nd IF	Z1—1st IF
2	User radiating loop (See note 1 below).	1620 KC (gang fully open)	Pre-set C2A (Ant.) 1/2 turn from tight. Adjust for maximum output.	C1B—osc. trimmer		
3	Same as step 2.	1400 KC	Adjust for maximum output.	C1A—ant. trimmer		
4	Same as step 2. Panel MUST be re-mounted in cabinet.	600 KC	600 KC Rock tuning gang while making this adjustment.	T1—osc. core		
5	Repeat steps 2, 3 and 4 until no further improvement is obtained. Always stop on step 2.					

NOTE 1. Use a 6-to-8 turn, 6-inch diameter loop made up of insulated wire. Connect to generator terminals, and place about one foot from radio loop.

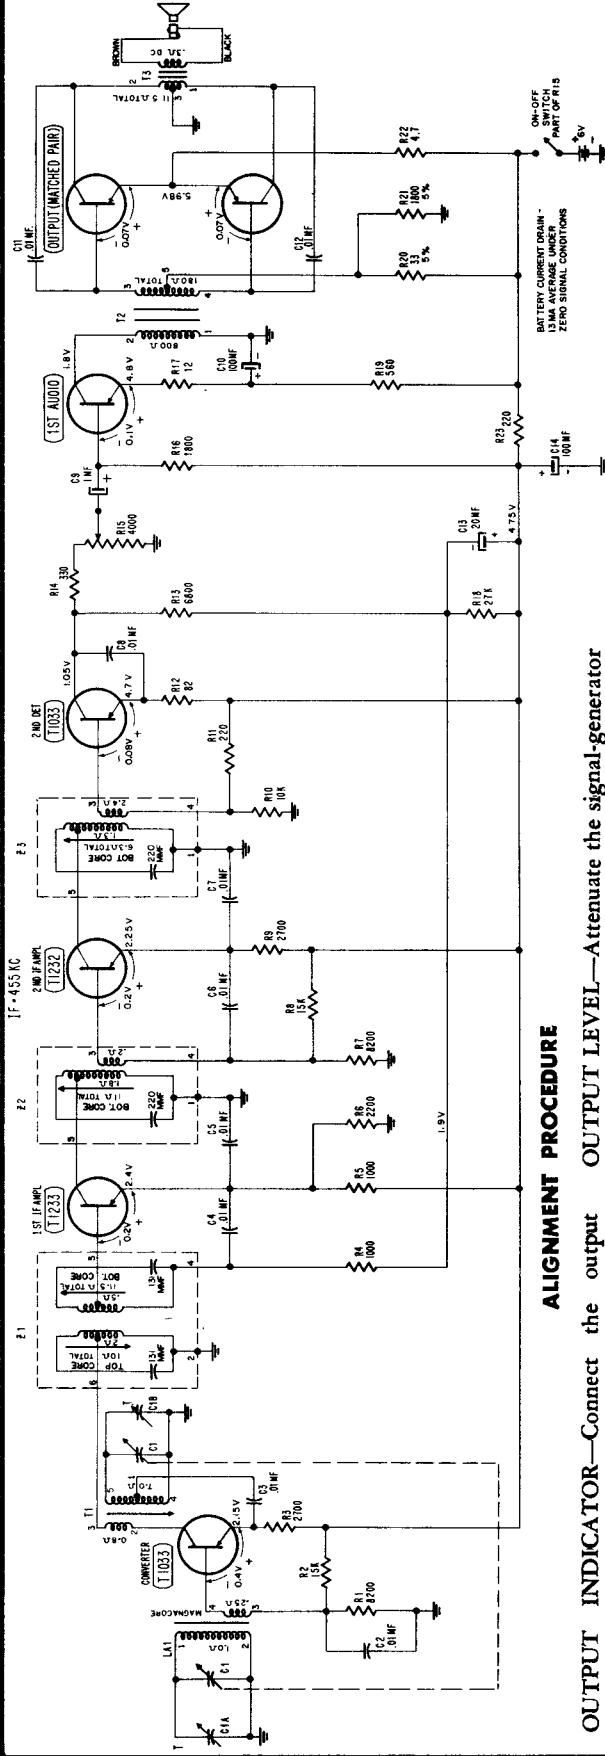

## TERMINAL LUG IDENTIFICATION

## PHILCO TRANSISTOR RADIOS

**MODELS T-700 and T-800  
CODES 124 and 126**

(Continued on page 121, at right)

### ALIGNMENT PROCEDURE

**OUTPUT INDICATOR**—Connect the output indicator (a 1000-ohm-per-volt, a-c voltmeter, or an oscilloscope) across the voice-coil terminals.

**SIGNAL GENERATOR**—Use an AM rf signal generator. Connect the ground lead to chassis, and connect the output lead as indicated in the alignment chart.

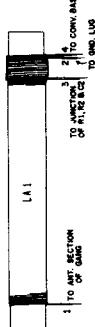

**OUTPUT LEVEL**—Attenuate the signal-generator output throughout the alignment so as to maintain the output level below .4 volt.

**RADIO CONTROLS**—Set the volume control to maximum. Set the tuning control as indicated in the alignment chart.

### ALIGNMENT CHART

STEP	SIGNAL GENERATOR CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	RADIO	ADJUST
1	Connect signal generator through a .1-uf. condenser to ant. section of gang.	455 kc.	Tuning gang fully open.		Z3—3rd i-f pri. Z2—2nd i-f pri. Z1—1st i-f sec. (Bottom Core) Z1—1st i-f pri. (Top Core)
2	Use radiating loop. (See NOTE 1 below).	600 kc.	600 kc.		T1—osc. core

Z10	Battery bracket and contact assy., center	78-10142

## SERVICE NOTES

When signal tracing, inject signal at transistor collector and limit input to keep signal across speaker below 0.4 volts. Normally, the transistors should be the last item suspected.

The dress (position) of condenser C8 may be helpful in reducing harmonic whistle when encountered. C8 may be bent over toward R14 and the detector transistor. In sets where C8 is in this bent position, do not disturb.

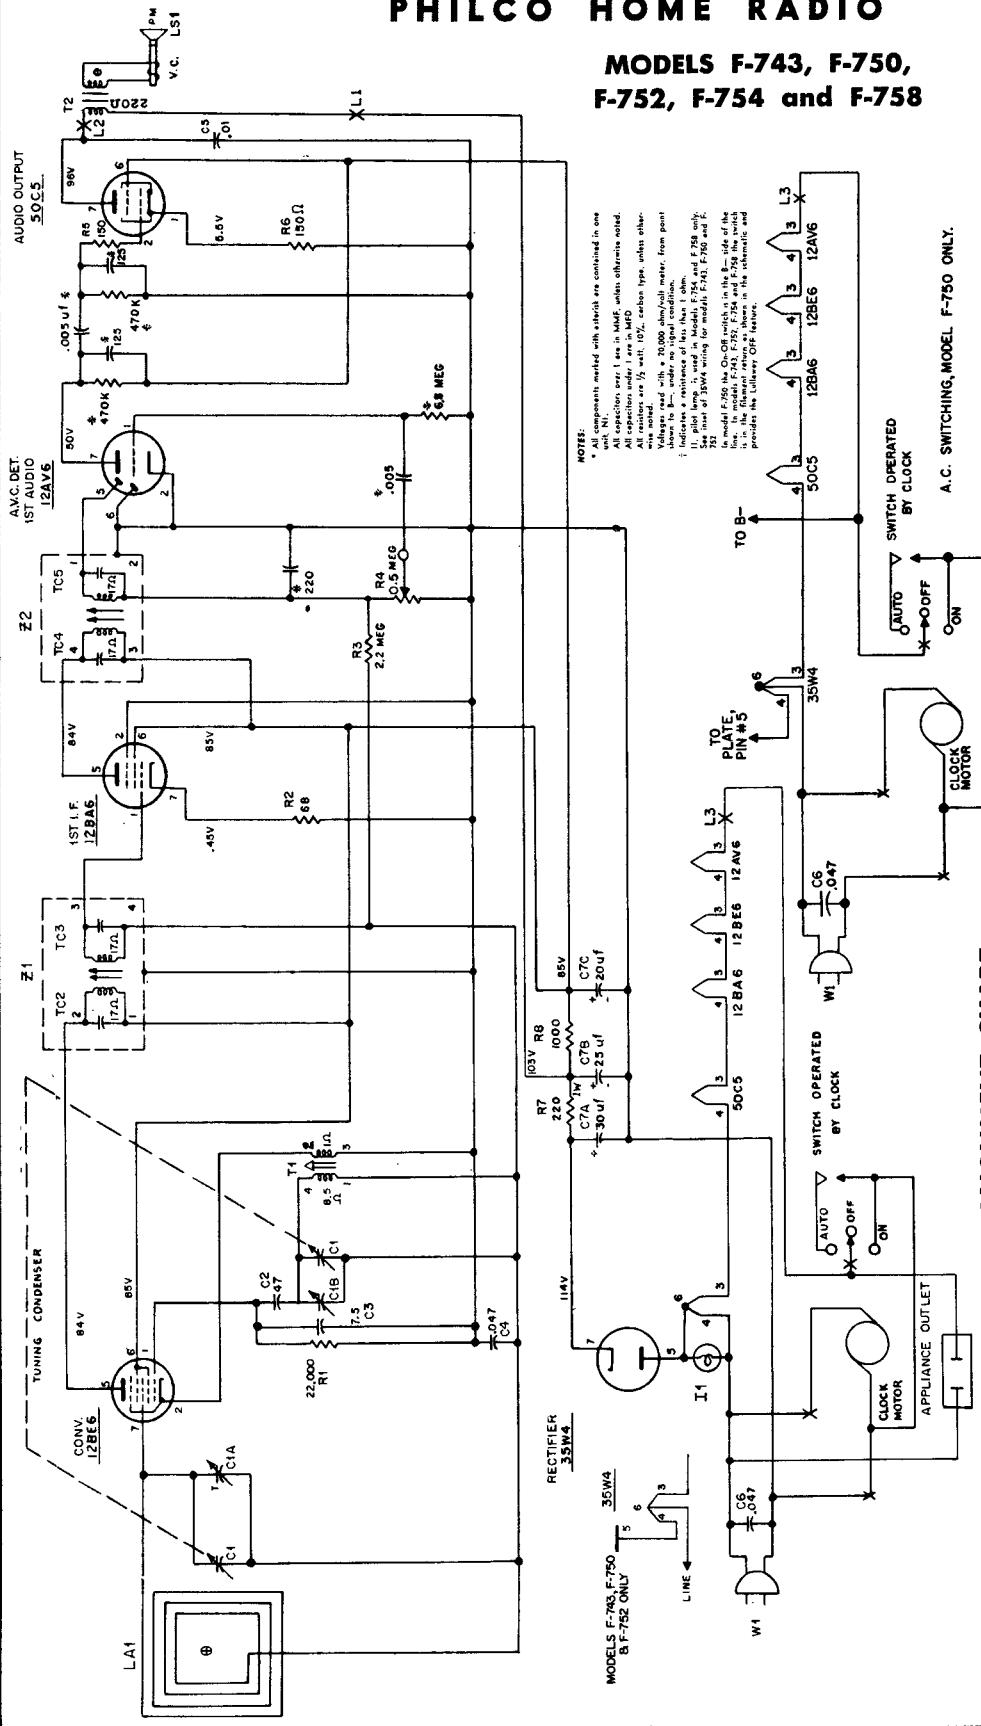

(Continued from page 120)

\* LOOP LEADS 3 & 4 DRESS BETWEEN EDGE OF PRINTED PANEL & MASONITE FRONT PLATE & CONNECT TO TIE LUGS INDICATED ON FOIL SIDE OF PANEL.

SEE "SERVICE NOTES" FOR DRESS OF C8.

# PHILCO HOME RADIO

**MODELS F-743, F-750,  
F-752, F-754 and F-758**

## CHASSIS REMOVAL

(1) Remove Back: In models F-750, F-752, F-754 and F-758 there are two screws holding the back to the cabinet. In model F-743 spring the cabinet top to allow the back top to come back and out. Then lift (or side upwards) the back to free back from bottom slots. Disengage interlock.

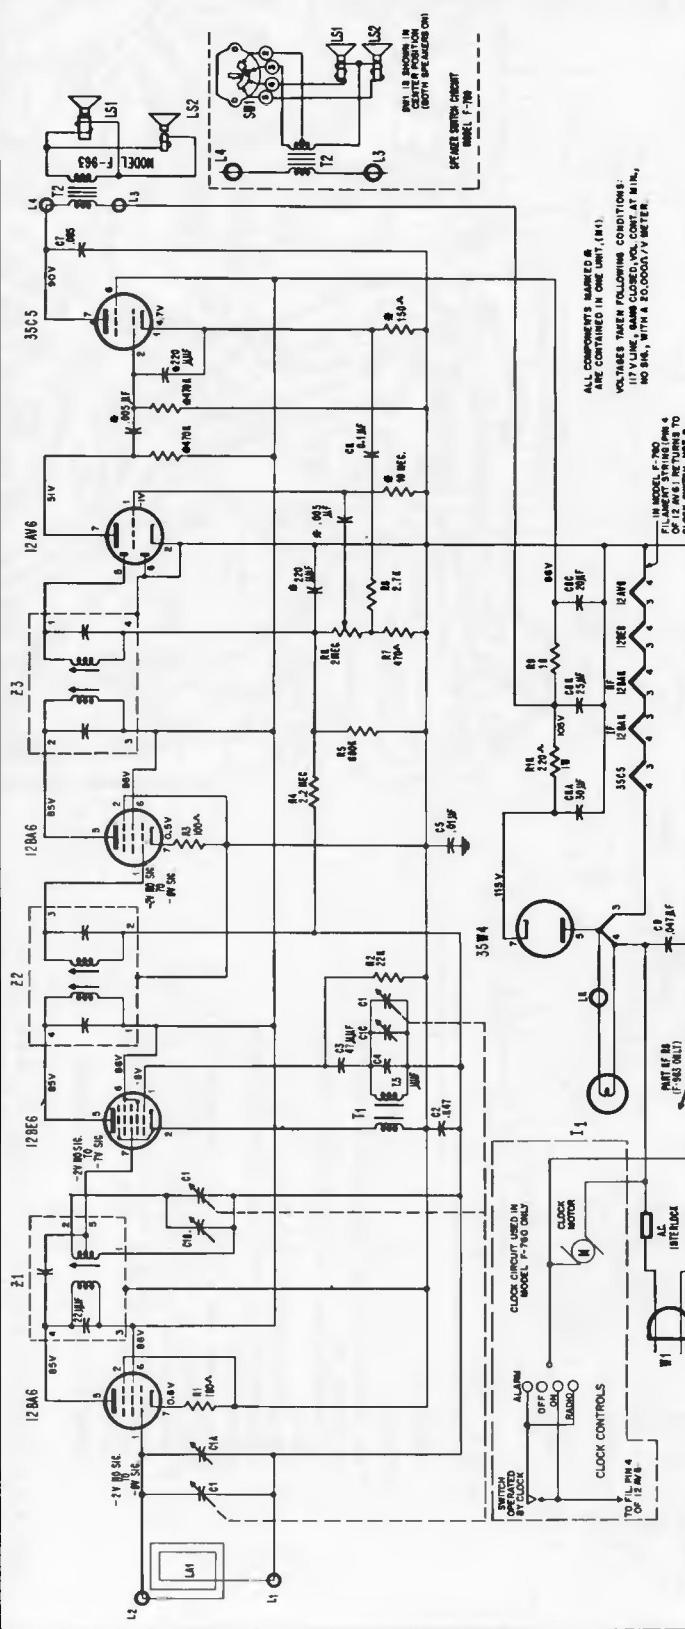

(2) Remove the drive screw which holds the volume control frame to a boss on inside of cabinet.  
 (3) It may be desirable or necessary to unsolder the speaker and clock leads.

STEP	SIGNAL GENERATOR CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	ADJUST
1.	Ground lead to B-; output lead through a 1 mf condenser to grid (pin 7) of 12B6s or top of 1-f tuning condenser.	455 kc.	Tuning gang fully open.	Adjust tuning cores, in order given, for maximum output. TC3 and TC5 are located on top of transformers.	TC5—2nd i-f sec. TC4—2nd i-f pri. TC3—1st i-f sec. TC2—1st i-f pri.
2.	Radiating loop (See Note below).	1620 kc.	1620 kc.	Adjust for maximum output.	C1-B—osc.
3.	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum output.	C1-A—aerial

**NOTE:** Make up a 6-8 turn, 6 inch diameter loop from insulated wire, connect to signal-generator leads, and place near radio loop.

# PHILCO

## MODELS F-760 and F-963

### SPECIFICATIONS

Cabinet: Plastic, table model; Model F-963 has a rotary dial scale with a 5:1 drive ratio. Model F-760 has a slide rule dial with a 6:1 drive ratio.

Frequency Coverage: 535KC to 1620KC.

Intermediate Frequency: 455 KC.

Audio Output: 0.9 watts.

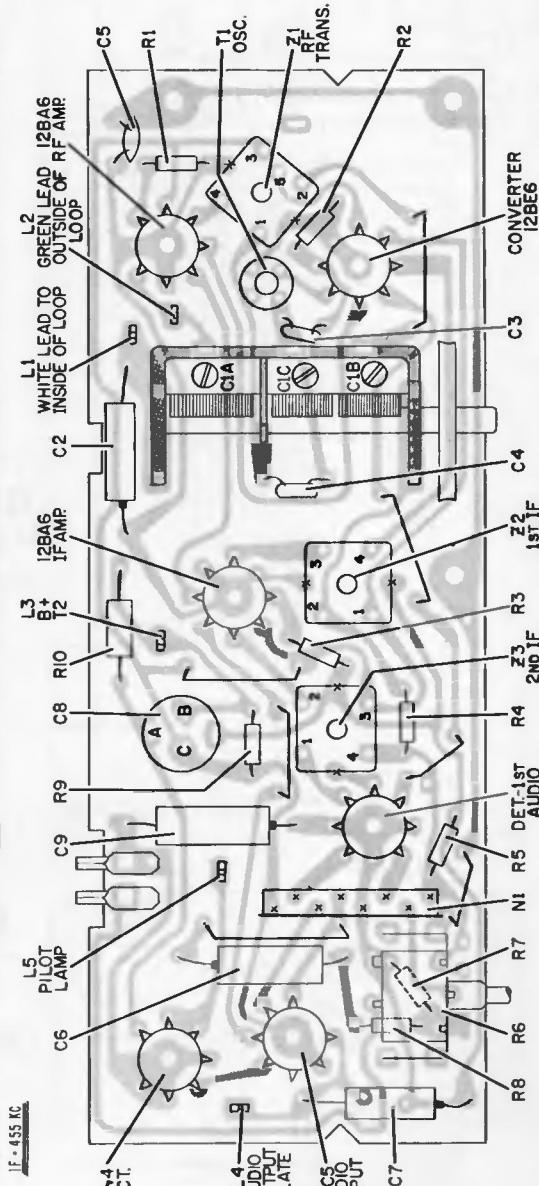

Operating Voltage: Model F-963—105 to 120 volts, AC-DC; Model F-760—105 to 120 volts, AC.

Aerial: High impedance loop mounted on back.

Speakers: (2) 4" pm speakers, each with 3.2 ohm voice coil.

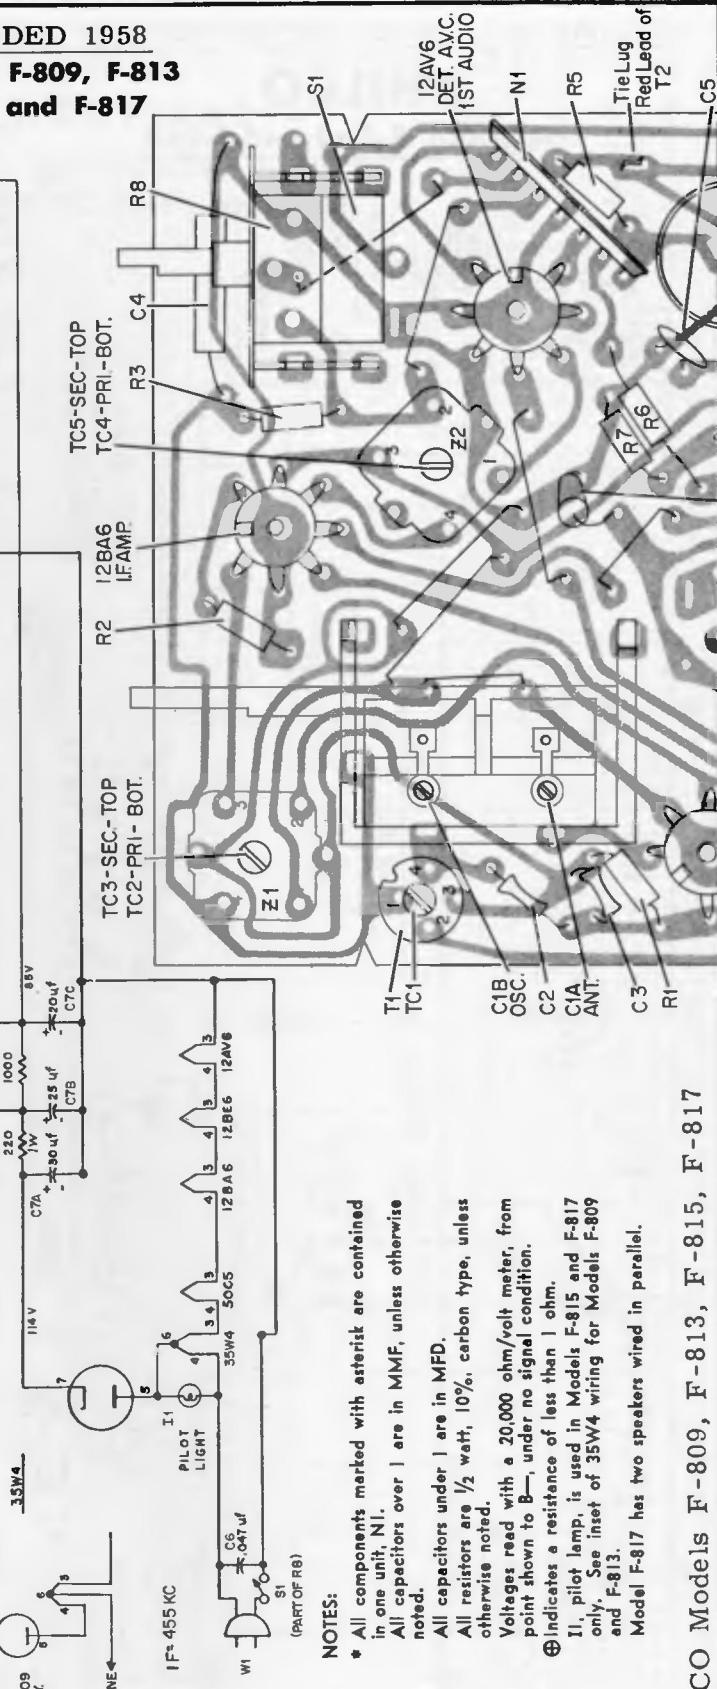

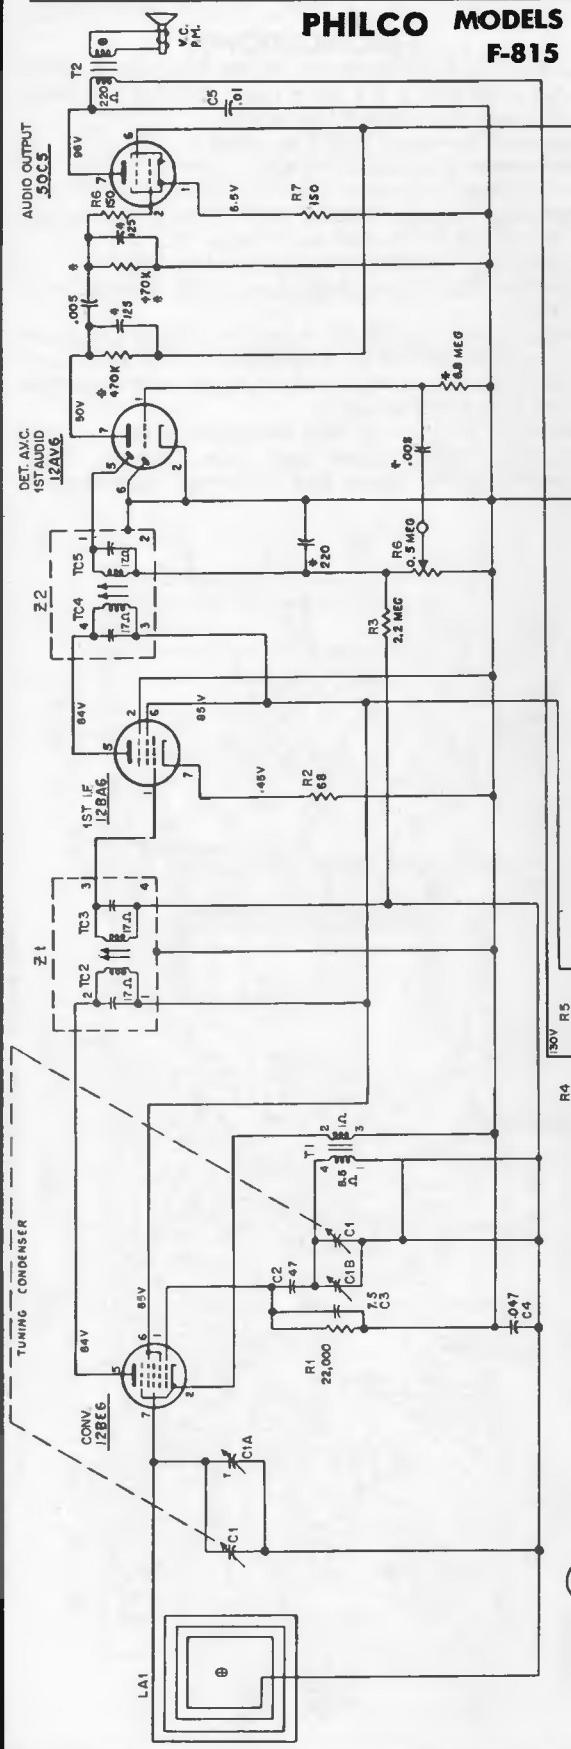

Philco Tubes: 12BA6 RF Amplifier, 12BE6 Oscillator-Converter, 12BA6 IF Amplifier, 12AV6 Detector-AVC-1st Audio, 35C5 Audio Output, 35W4 Rectifier and a type 47 Dial Light.

Timer: F-760 only—A fully automatic Telechron (type C-103) internal timer and clock. Includes Sleep-Switch, Buzzer Alarm, and "Lullaway" Slow Shut-off.

Composite View, Component Layout of Printed Panel

# **PHILCO MODELS F-809, F-813 F-815 and F-817**

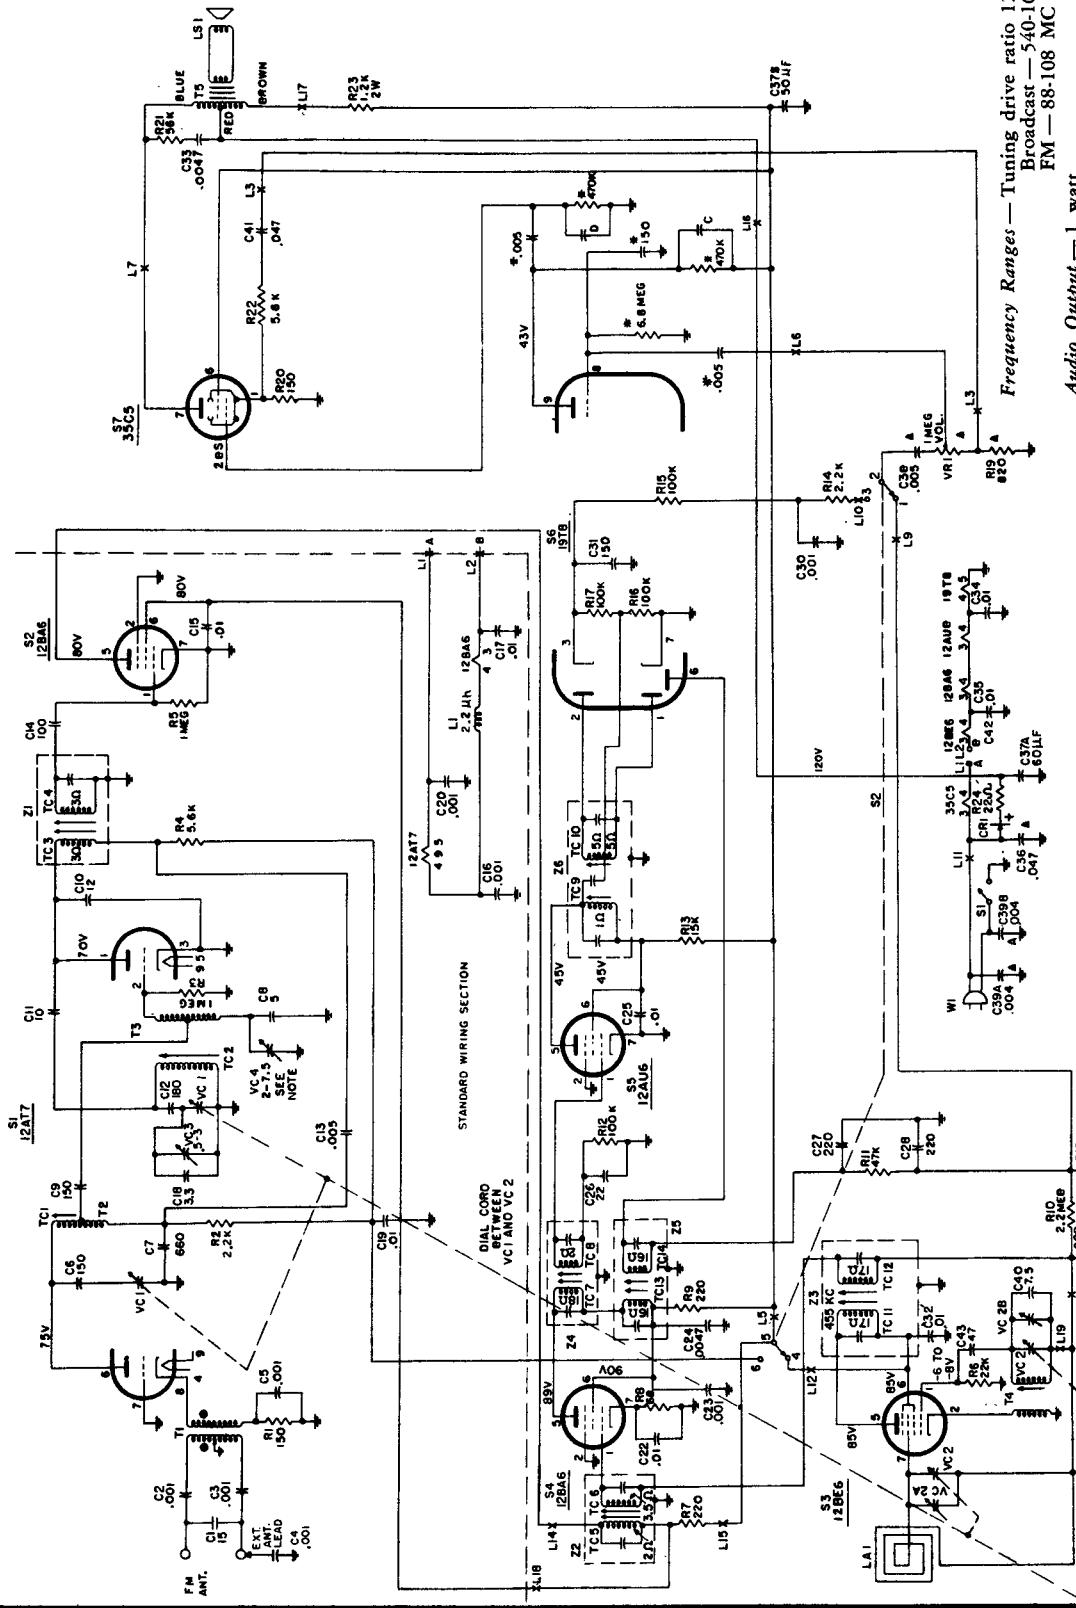

**NOTES:**

- All components marked with asterisk are contained in one unit, N1.  
All capacitors over 1 are in MMF, unless otherwise noted.  
All capacitors under 1 are in MFD.  
All resistors are  $\frac{1}{2}$  watt, 10%, carbon type, unless otherwise noted.  
Voltage read with a 20,000 ohm/volt meter, from point shown to B— under no signal condition.  
Indicates a resistance of less than 1 ohm.  
11, pilot lamp, is used in Models F-815 and F-817 only. See inset of 35W4 wiring for Models F-809 and F-813.  
Model F-817 has two speakers wired in parallel.

# PHILCO HOME RADIO

## AM/FM MODEL F-974

VC4 IS A FACTORY ADJUSTMENT AND SHOULD NOT BE MADE. IT MINIMIZES OSCILLATOR RADIAL POSITION. TO ADJUST, TURN RADIO TO FM AND ADJUST VC4 FOR MINIMUM INDICATION ON A FIELD STRENGTH METER TUNED TO THE OSC FREQ.

\* COUPLE LINE  
▲ PART OF STANDARD WIRING  
● INDICATES LESS THAN 1 OHM  
CONDENSERS C = D = 250 μuf

ALL RESISTORS ARE 1/2 WATT, 10% UNLESS OTHERWISE NOTED.  
ALL CAPACITORS ABOVE 1 ARE IN μuf UNLESS OTHERWISE NOTED, ALL CAPACITORS BELOW 1 ARE μuf.

*Frequency Ranges — Tuning drive ratio 12:1*  
*Broadcast — 540-1620 KC*  
*FM — 88-108 MC*

*Audio Output — 1 watt*

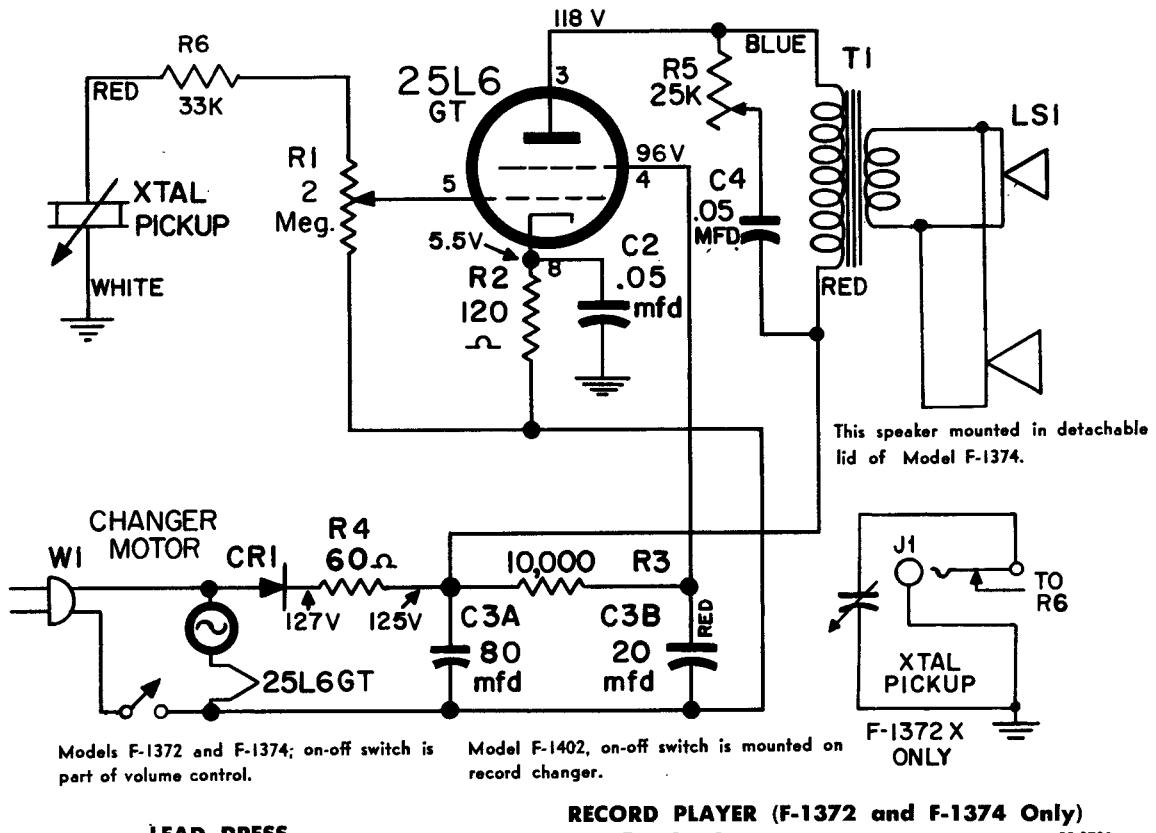

*Operating Voltage — 105 - 120 volts, a.c./d.c.*

*Power Consumption — 40 watts*

*Antennas — AM — Built in high impedance, pancake loop*  
*FM — Line cord with provision for connecting external antenna.*

*Intermediate Frequency — AM 455 KC*  
*FM 10.7 MC*

**PHILCO MODELS F-1372, F-1372X, F-1374 and F-1402**

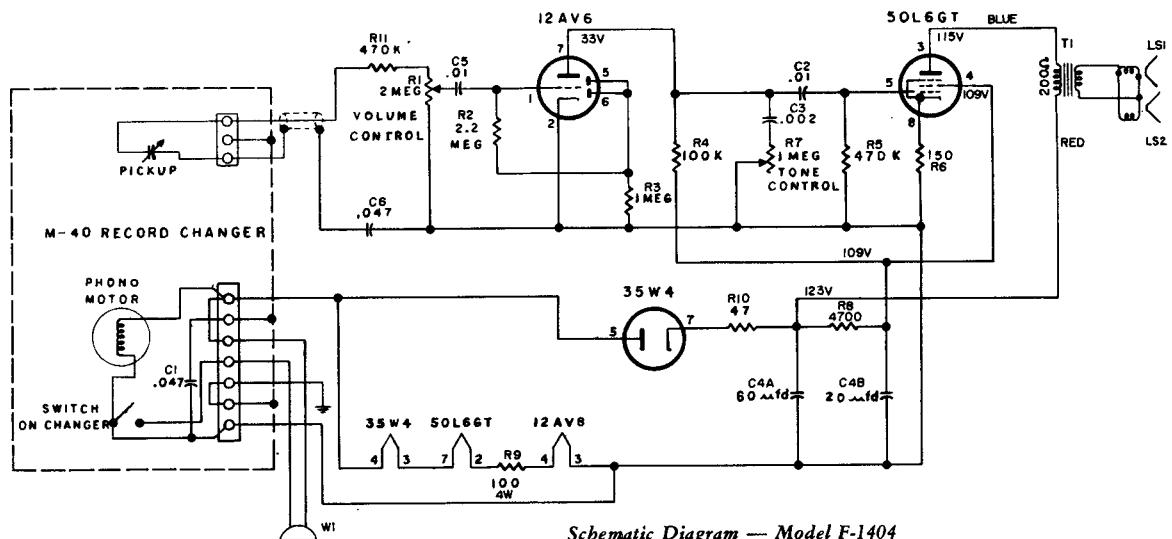

**LEAD DRESS**

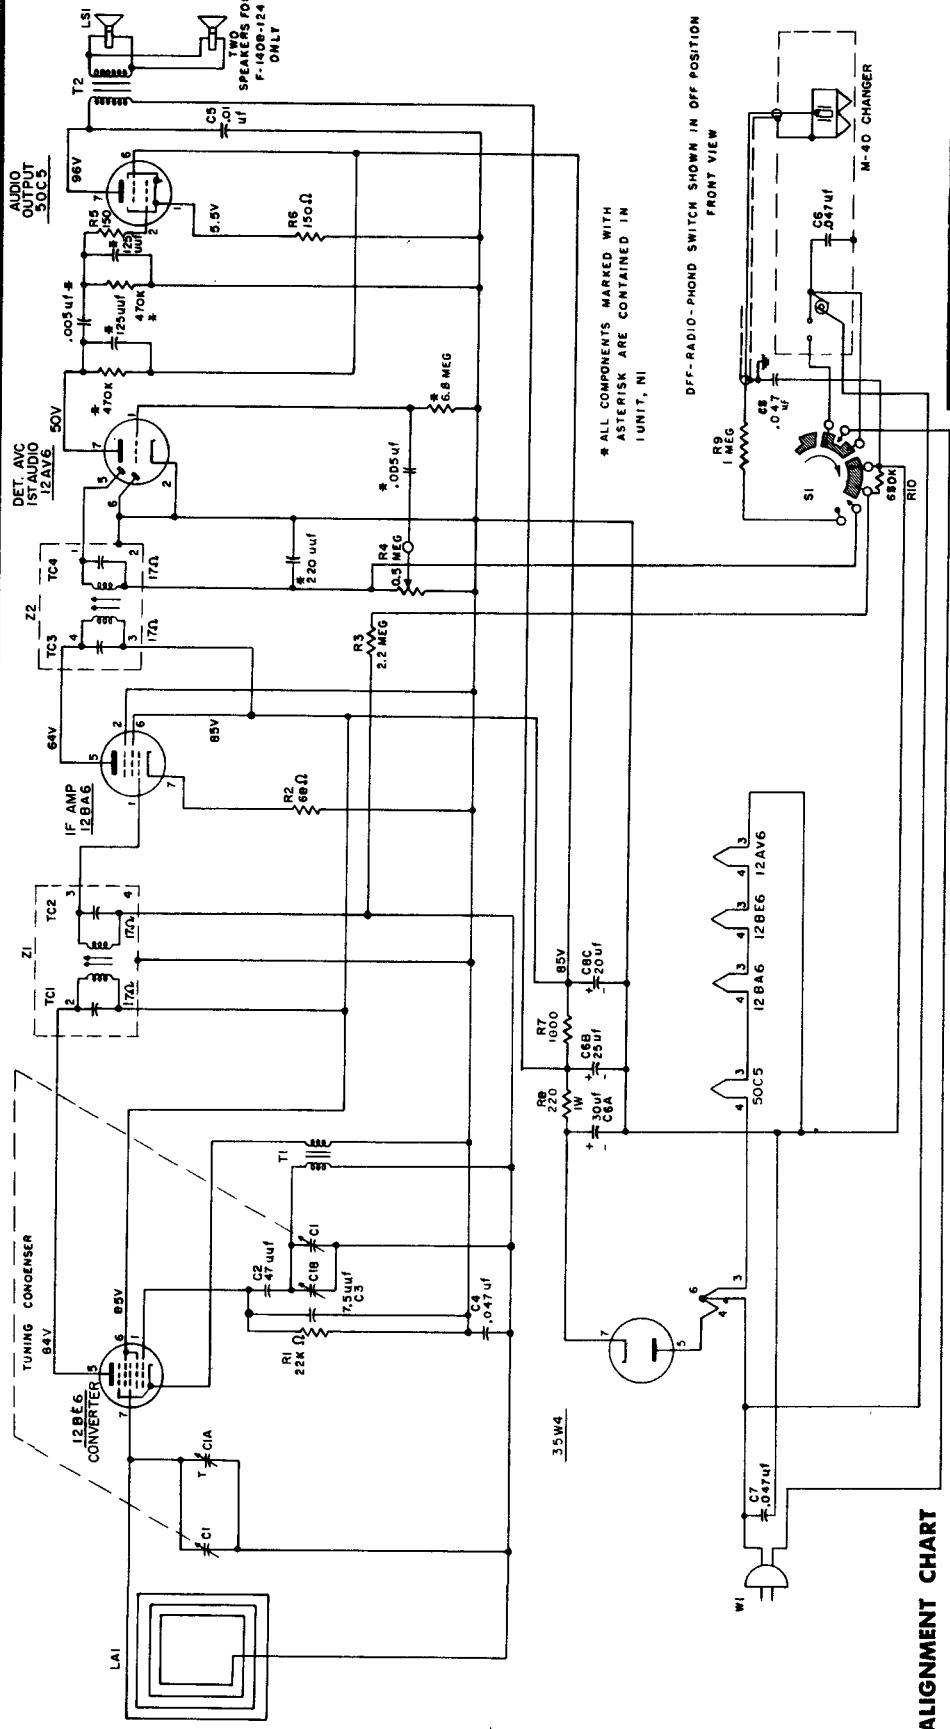

R4, the surge limiting resistor, should be dressed up in the air and all leads and components kept away. This resistor operates at a high temperature that could damage lead insulation or cause value changes in components in contact with it.

## PHILCO PHONOGRAPH

**MODEL F-1500**

### REMOVAL INSTRUCTIONS

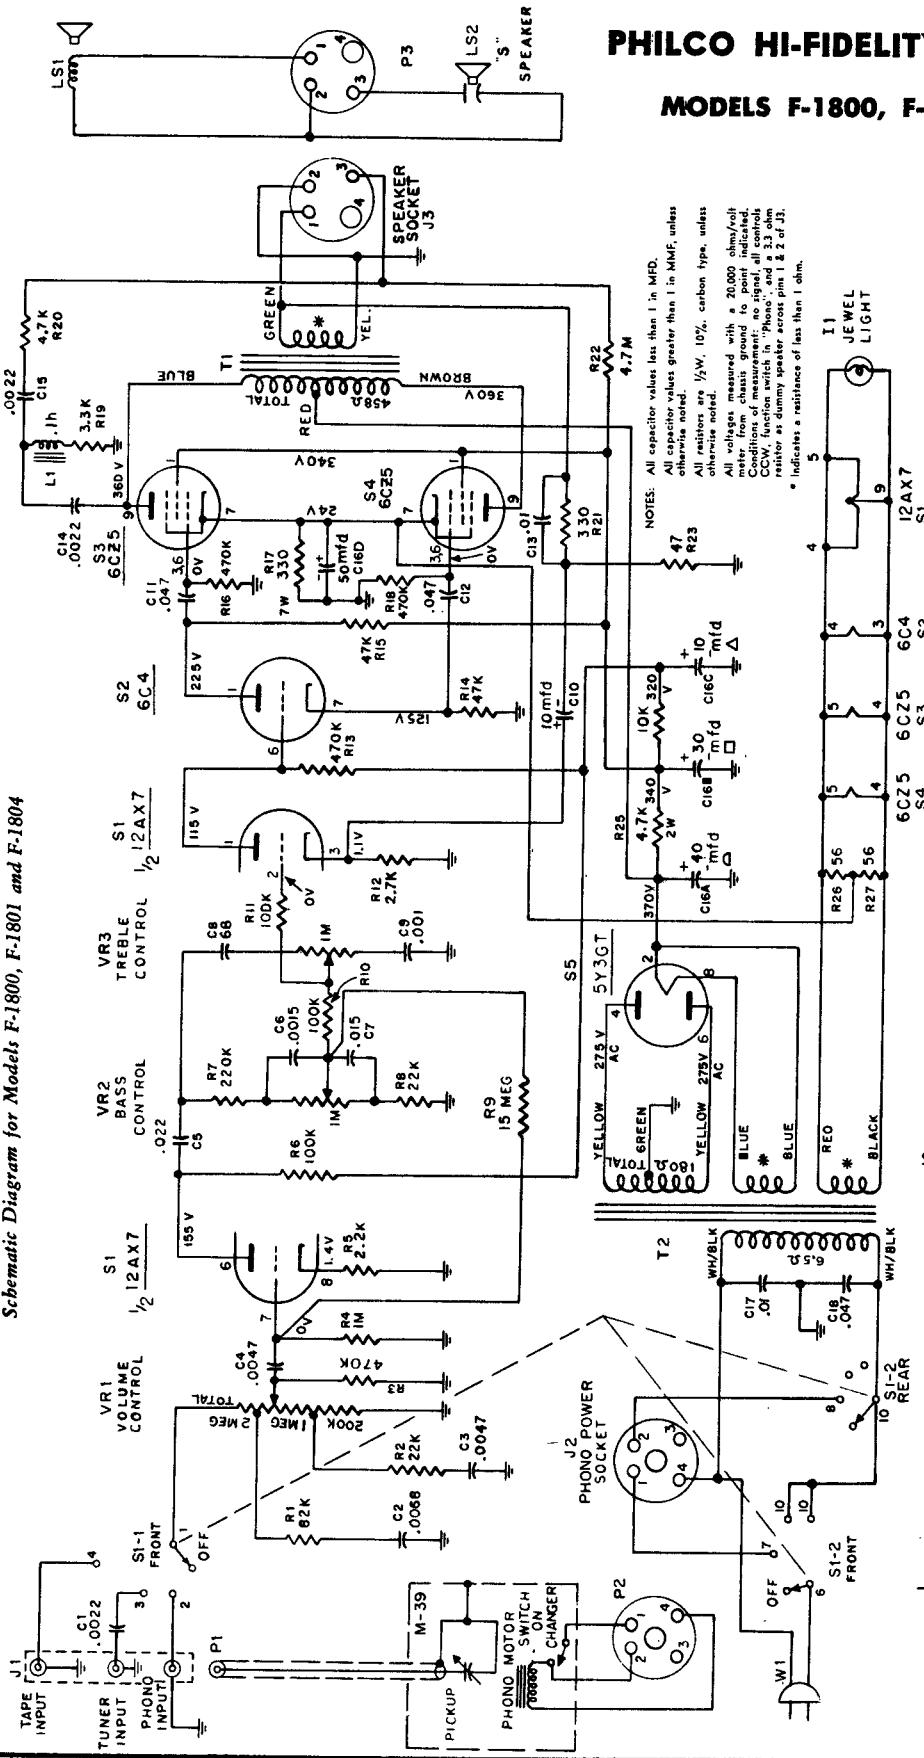

#### AMPLIFIER

- (1) Pull the three control knobs from the right-hand side of the phonograph.
- (2) Remove metal grill from inside of phonograph.
- (3) Pull the three plugs from the amplifier.
- (4) Loosen right-hand amplifier mounting nut, about half way.
- (5) Remove left-hand amplifier mounting nut. Raise the left-hand side of the amplifier while sliding the amplifier from the right-hand mounting screw.

- (1) Remove amplifier.
- (2) Check that the "hold-down" bolts are in "play" position (Head of bolt flush with changer base plate).
- (3) Reach under the motor board and flip the toggle on the bottom of the right-hand "hold-down" bolt. It will be easier to operate the toggle if the right-hand side of the changer is pressed downward.
- (4) Raise the right-hand side of the changer until the "hold-down" bolt is free and then slide the changer to the right. The left-hand "hold-down" bolt is mounted in a slot of the motor board. The bolt will slide free as the changer is moved to the right.

## PHILCO HI-FIDELITY PHONOGRAPHS

MODELS F-1800, F-1801 and F-1804

### LEAD DRESS INFORMATION

Avoid placing components or leads near R17, the 7 watt, output cathode resistor, or R25, the 2 watt, B+ filter resistor. Both resistors operate at a high temperature and may damage any component in contact with them.

The AC leads should be dressed along the sides and down against the subbase.

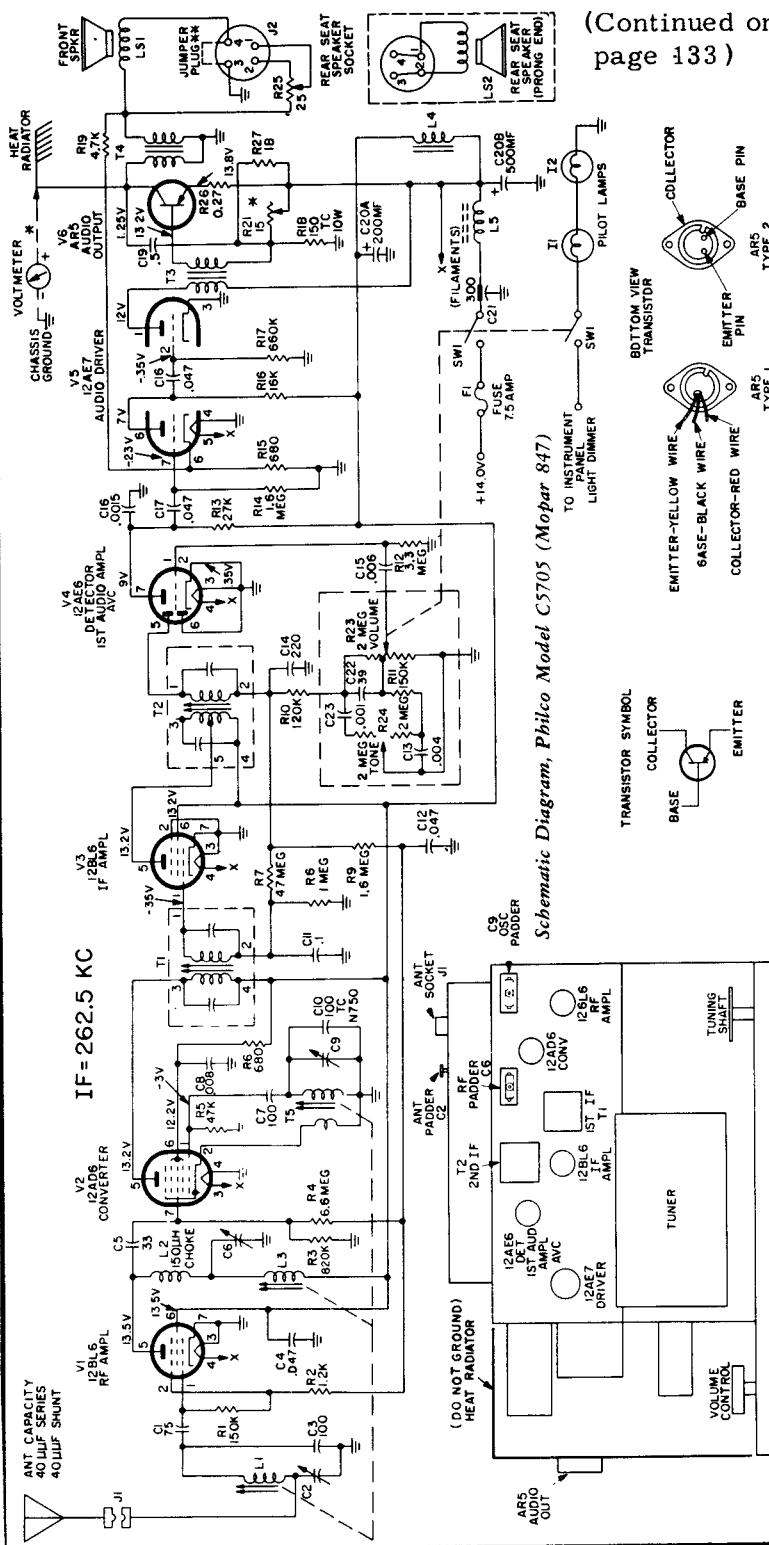

Care should be taken not to break the wax seal covering L1, the tweeter cross-over choke.

**RECORD CHANGER**—Philco 4-speed automatic record changer, model M-39. 7-in., 10-in. and 12-in. intermix. Automatic shut-off of entire instrument at end of last record.

**SWITCH SHOWN IN MAX. COUNTER CLOCKWISE POSITION "OFF"**  
**SWITCH VIEWED FROM KNOB END**  
**S1-1 IS A SHIELD SECTION, CONTACT 5 IS GROUNDED.**

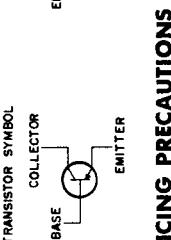

**PHILCO AUTO RADIO****MODEL - C-5705-P-5701**

Models P5701 (Mopar 848) and C5705 (Mopar 847) are electrically identical except that Model C5705 has two pilot lamps, a rear seat speaker socket, a fader control, and a tone control (with C22 & C23).

(Continued on page 133)

Schematic Diagram, Philco Model C5705 (Mopar 847)

**SERVICING PRECAUTIONS**

A-C leakage from measuring instruments or soldering irons may damage the transistor. All transistor measurements should be made with a battery-operated instrument. When soldering is necessary, disconnect set from power source.

Do not operate these receivers with the speaker disconnected, as transient voltages across an unloaded output transformer may damage the transistor. When installing a new transistor, a good physical and electrical contact must be established between the collector and the heat radiator; care must be exercised when soldering, since excessive heat may melt the internal junctions. To adjust the bias, first make sure that the bias control, R21, is set at the center of its range. Then adjust the bias control for 500 ma. collector current, or for 1.25 volts, d.c., across the output transformer primary, with no input signal. (This bias control is "HOT" to ground — use insulated adjustment tool).

## NOTES

- ALL RESISTANCE VALUES ARE IN OHMS  $\pm 10\%$ , 1/2 WATT, UNLESS OTHERWISE INDICATED.
- ALL CAPACITANCE VALUES OF 1.0 AND ABOVE ARE IN MF,  $\pm 20\%$ ; AND ALL VALUES BELOW 1.0 ARE IN MF  $\pm 20\%$ , UNLESS OTHERWISE INDICATED.
- \* ADJUST FOR 500 MA. COLLECTOR CURRENT OR 1.25 V DC DROPS ACROSS OUTPUT TRANSFORMER PRIMARY (NO SIGNAL INPUT). DO NOT USE A VACUUM TUBE VOLTMETER FOR THIS MEASUREMENT.
- \*\* REMOVE JUMPER PLUG FOR REAR SEAT SPEAKER INSTALLATION.

- VOLTAGE MEASUREMENTS WERE MADE WITH SET OPERATING FROM NO VOLTS, DC, SUPPLY. TUNING CONTROL SET AT LONG-FREQUENCY END OF BAND. NO SIGNAL INPUT. ALL MEASUREMENTS ARE FROM POINT INDICATED TO CHASSIS, UNLESS OTHERWISE SPECIFIED. OSCILLATOR GRID VOLTAGE WAS MEASURED WITH AN ELECTRONIC VOLTMETER HAVING A ONE-MEGOHM PROBE ISOLATING RESISTOR. ALL OTHER MEASUREMENTS WERE TAKEN WITH A 20,000-OHM PER-VOLT METER.

DC RESISTANCES		
T1	1.0 OHMS	PRI 35 OHMS
T2	5.0 OHMS	SEC 35 OHMS
T3	7.5 OHMS	PRI 13.3 OHMS
T4	15.0 OHMS	SEC 2.0 OHMS
T5	1.0 OHMS	PRI 2.0 OHMS
T6	3.3 OHMS	SEC 1.0 OHMS
T7	3.3 OHMS	PRI 1.0 OHMS
T8	3.3 OHMS	SEC 1.0 OHMS

**MODEL P-5701 AND C-5705**  
To correct audio frequency response the 1st audio plate load resistor (R13) has been changed in value to 470,000 ohms, the 2nd audio grid return resistor (R14) has been changed to 4.7 megohms and the .0015 mid, 1st audio plate bypass condenser, C16, has been removed.

**SETTING PUSH BUTTONS**

- Turn radio on and allow it to operate for fifteen minutes. Antenna should be fully extended.
- Unlock push buttons to that station by pushing firmly in.
- Accurately tune in a station with manual tuning knob.
- Lock one push button to that station by pushing firmly in.
- Repeat above procedure for remaining push buttons.

PHILCO Models C-5705 and P-5701, Alignment Procedure, Continued

**GENERAL**—The cover must be removed in order to perform the alignment procedure. Allow the set and the test equipment to warm up for fifteen minutes before starting the alignment procedure. Make sure that all plugs and cables are connected to their proper receptacles.

**OUTPUT INDICATOR**—Connect the output indicator (an oscilloscope or a 1000-ohm-per-volt, a-c voltmeter) across the voice-coil terminals.

**SIGNAL GENERATOR**—Use an AM r-f signal generator with 30% modulation. Connect the ground lead to the chassis, and the output lead as indicated in the alignment chart.

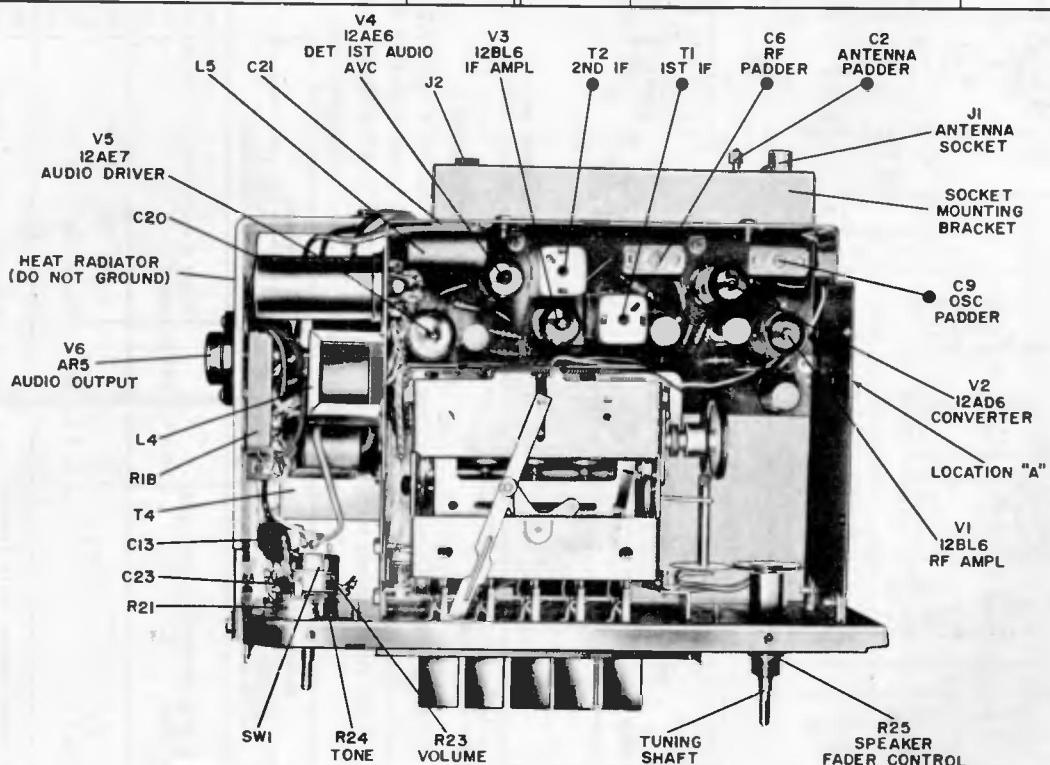

**OUTPUT LEVEL**—Attenuate the signal-generator output throughout the procedure to hold the output indication below 1 volt.

**RADIO CONTROLS**—Set the volume control to maximum. Set the tone control to mid-range (in C5705 only). Set the tuning control as indicated in the alignment chart.

**DUMMY ANTENNA**—When making the r-f and antenna tuning adjustments, connect the signal-generator output lead through a 40- $\mu$ uf. condenser to the antenna receptacle, and connect another 40- $\mu$ uf. condenser from the antenna receptacle to the chassis.

### SERVICING PRECAUTIONS

A-C leakage from measuring instruments or soldering irons may damage the transistors. All transistor measurements should be made with a battery-operated instrument. When soldering is necessary, disconnect set from power source.

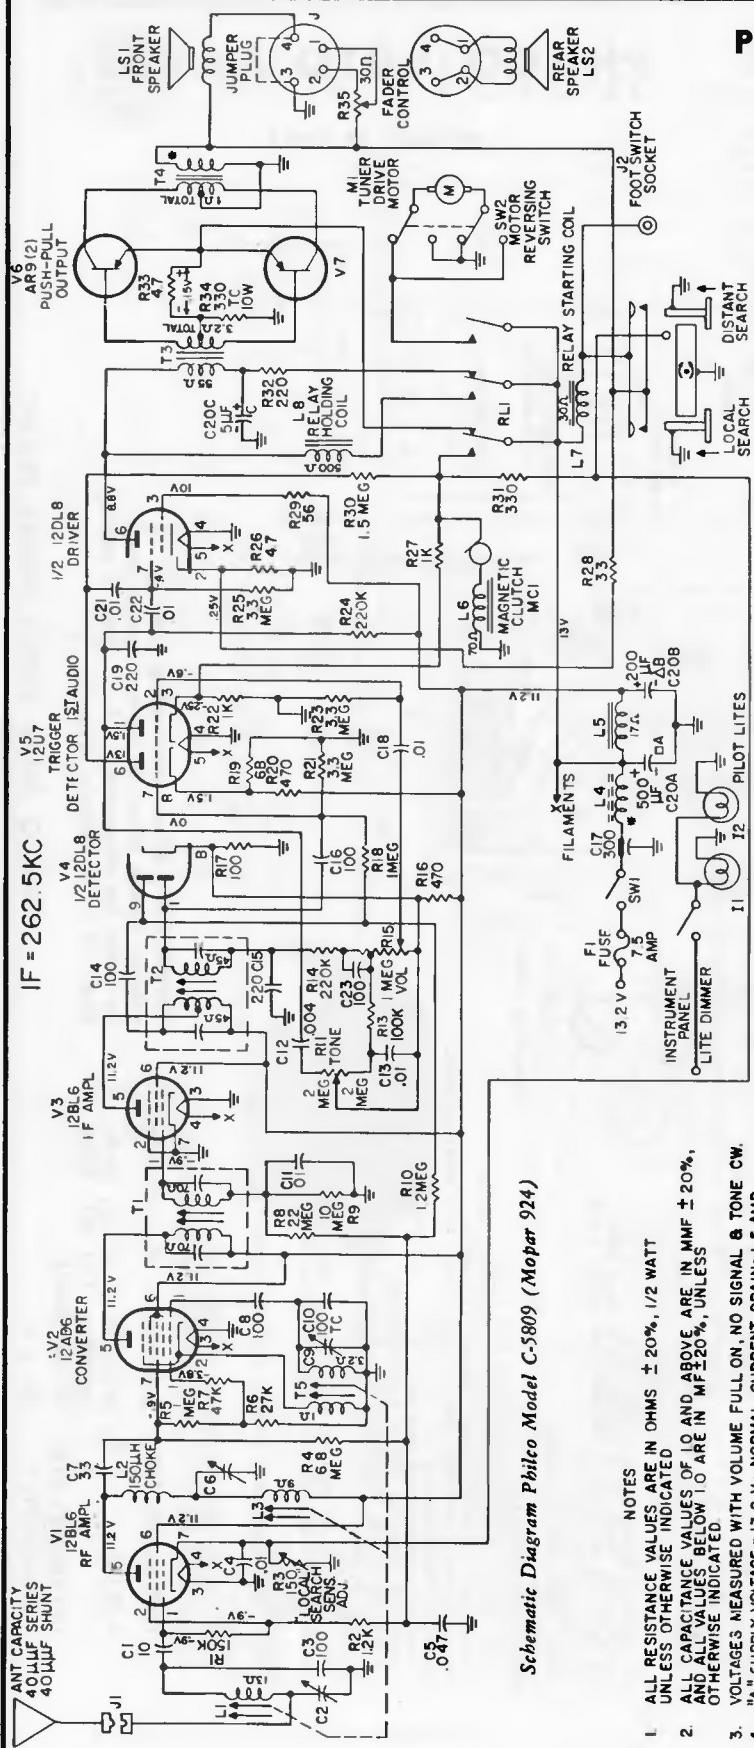

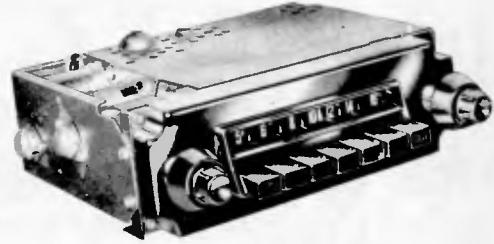

Do not operate these receivers with the speaker disconnected, as transient voltages across an unloaded output transformer may damage the transistors.

When installing a new transistor, a good physical contact must be established between the collector and the heat radiator. The transistor shell (connected to the transistor base) is insulated from the heat radiator by a film of plastic. The transistor must be mounted to give a good physical contact — the plastic film will allow heat conduction to the plate—but **MUST NOT** make electrical contact with the heat radiator plate. Use caution to prevent damage to the plastic film. Care must be exercised when soldering, since excessive heat may melt the internal junctions.

**CAUTION:** Do not ground the base of any of the transistors or serious damage will result to the transistor.

**PHILCO AUTO RADIO**

**MODEL C-5809**

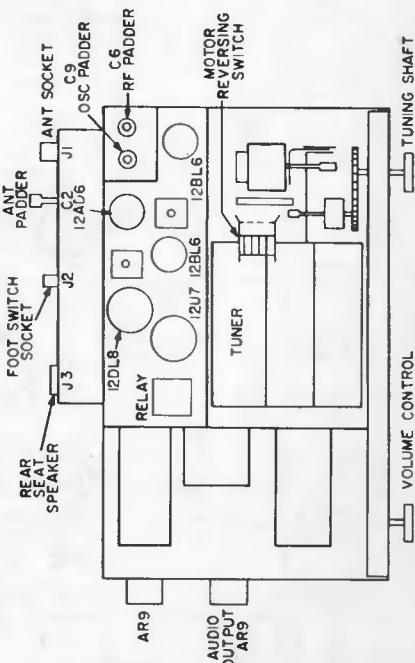

**SETTING PUSH BUTTONS**

Stations may be set up in any order. However, for convenience in remembering, it is suggested that stations be set up in frequency sequence.

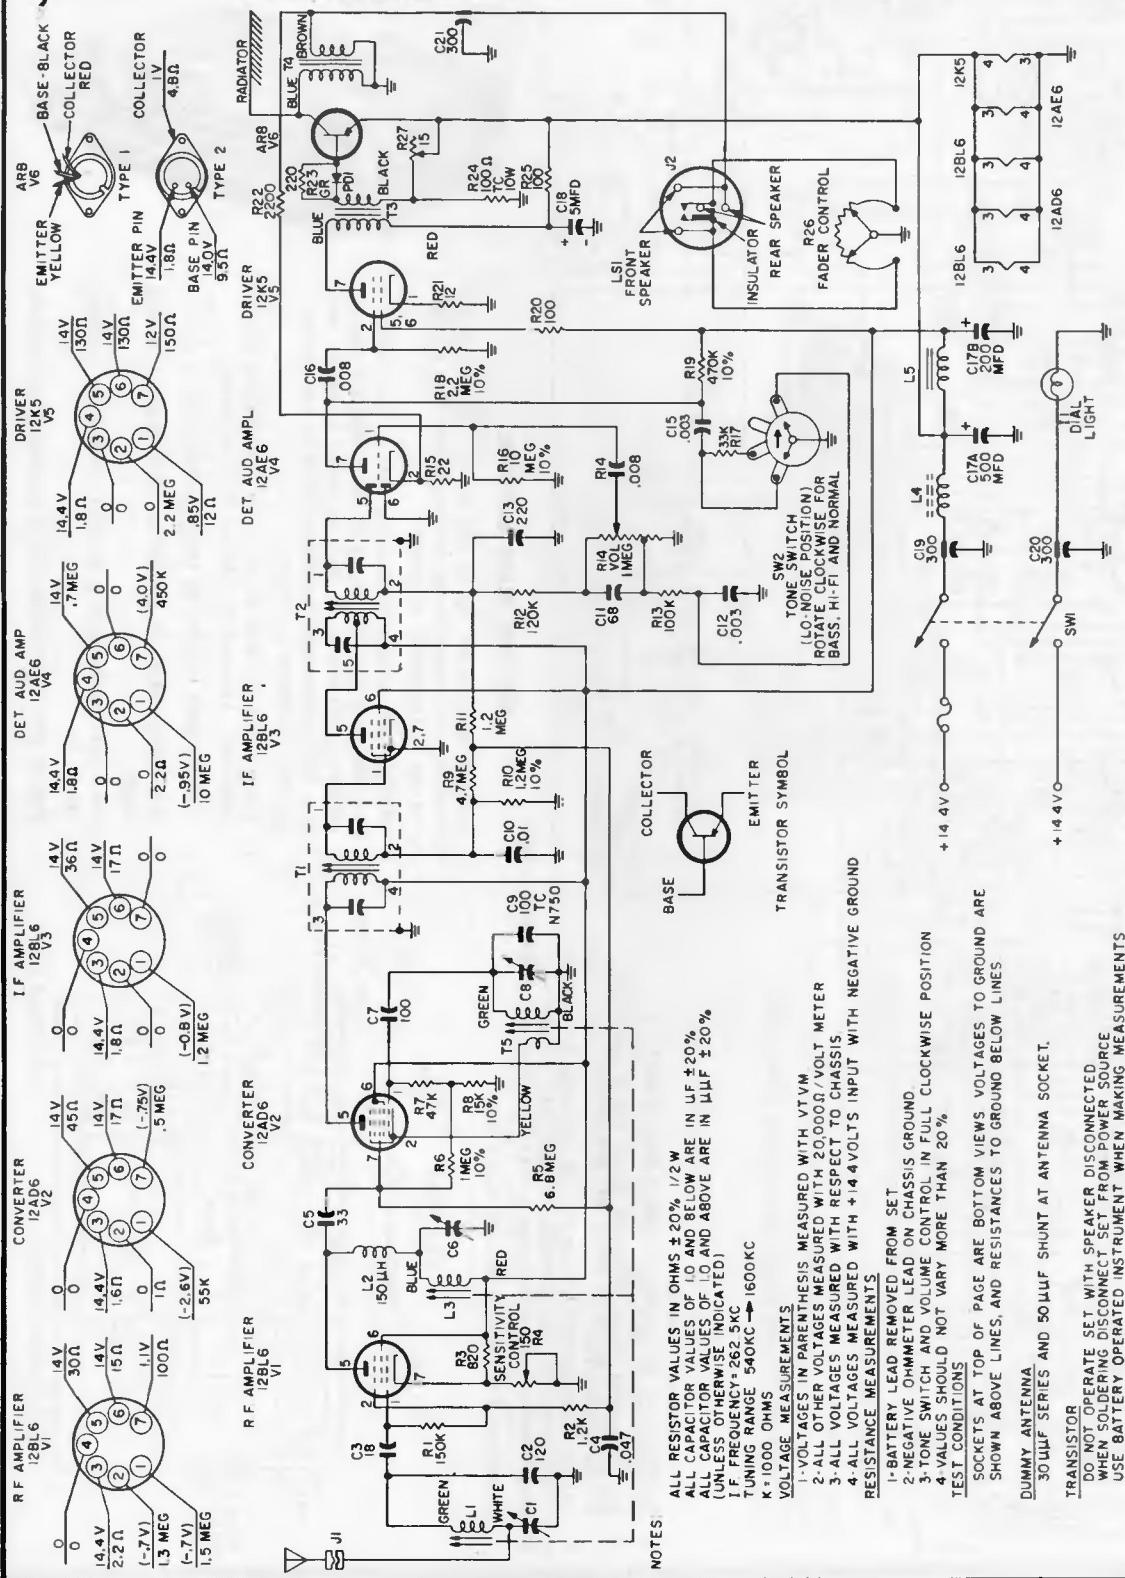

**NOTE:** In metropolitan areas, it is recommended that the push buttons be set up in a shielded place where signals are weak, such as under a viaduct or in a steel-constructed building. In this way, accuracy of adjustment is assured.

1. Turn radio on and allow it to operate for fifteen minutes. Antenna should be fully extended.
2. Unlock push buttons by pulling them out.
3. Accurately tune in a station with manual tuning knob.
4. Lock one push button to that station by pushing firmly in.
5. Repeat above procedure for remaining push buttons.

#### CRITICAL LEAD DRESS

Dress leads and components at gang so as not to interfere with rotor plates.

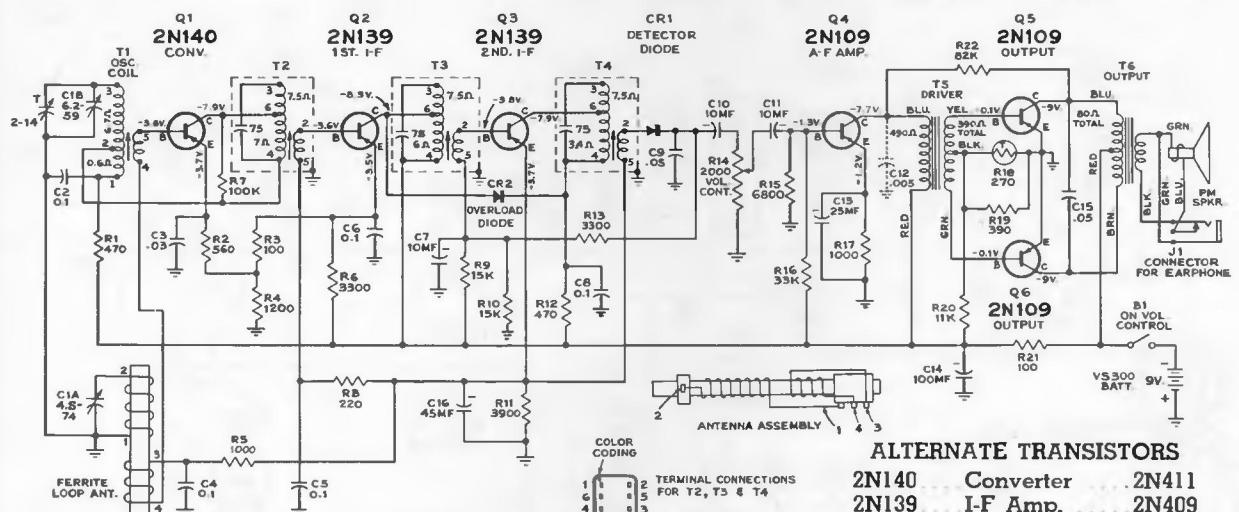

Dress lead from antenna to gang ant. terminal away from metal parts as far as practicable.

Check for possible solder shorts to volume control knob from printed circuit wiring.

Antenna terminal of gang must be bent to insure clearance to output transformer.

Dress "B—" lead from ON-OFF switch to battery under positive (+) lead of C16.

Dress antenna rod to clear end of case and such that antenna terminal does not interfere with closing of case back.

## SERVICE HINTS

## Recommended Test Procedure

Use signal tracing or signal injection as basic test procedure in conjunction with voltage measurements.

Make stage-by-stage check by injecting signal from signal generator and checking with a high-gain oscilloscope (at least .03 volts/inch). Oscillator action must be stopped in order to measure RF signal at converter base since oscillator signal also appears at this point. Oscillator action can be stopped by touching a finger to oscillator section of the tuning condenser.

**NOTE.** All transformers are step-down type and will show voltage loss from primary to secondary.

Extreme care should be used to avoid accidental shorting of transistor elements to circuit ground. This is especially true of the output transistors; if the junction of R18-R19-R20 should be accidentally grounded for a few seconds, the output transistors would be permanently damaged.

It is possible to damage a transistor when testing circuit continuity. Since a transistor needs only low voltage applied to its terminals for conduction, testing continuity of a circuit which includes a transistor can result in misleading continuity indications. To avoid transistor damage and misleading continuity indications, remove the transistor from the chassis before making continuity tests of its circuit.

1. The first thing to check when the receiver is inoperative, is the battery. With the receiver turned on, a new battery should show 9 volts although the receiver can be expected to operate on any battery which checks between 6 volts and 9 volts.
2. To check for a circuit defect which would cause excessive battery drain, an overall current measurement and supplementary voltage measurements should be made. For reasons explained above, continuity measurements can be misleading.
3. Signal tracing by injection of a signal from a signal generator is done on transistor radios in exactly the same manner as with conventional vacuum tube radios. The signal generator should be connected (as in past practice) in series with a capacitor to avoid shorting out bias voltages. With the transistors used in this receiver, the BASE is the signal input terminal (corresponding to signal grid of tubes), the COLLECTOR is the signal output terminal (corresponding to plate of tubes), and the EMITTER is the common terminal (corresponding to cathode of tubes).
4. The output of this receiver is of the "Class B" type. It should be noted that in "Class B" output the battery

current increases noticeably with increased signal input. Refer to the schematic diagram for current specifications.

5. Application of a signal from a signal generator to the input (B) of Q1 will stop oscillator action (R-F signal can not be injected at this point although 455 kc I-F signal can be injected).
6. Measurement of oscillator signal strength with an oscilloscope at the input of Q1 (base contact) will give an indication of oscillator performance. Voltage should be 0.20 to 0.70 volts peak-to-peak.
7. D-C measurements should be made only with a sensitive voltmeter, such as an RCA VoltOhmst®.
8. Interchanging transistors in the I-F stages may necessitate realignment.
9. The transistors and the printed wiring board can be readily damaged by excessive heat. When soldering on the printed wiring board, use a soldering iron which is both HOT and CLEAN. The soldering operation can then be completed quickly with a minimum of heat radiation to components.

## ALIGNMENT PROCEDURE

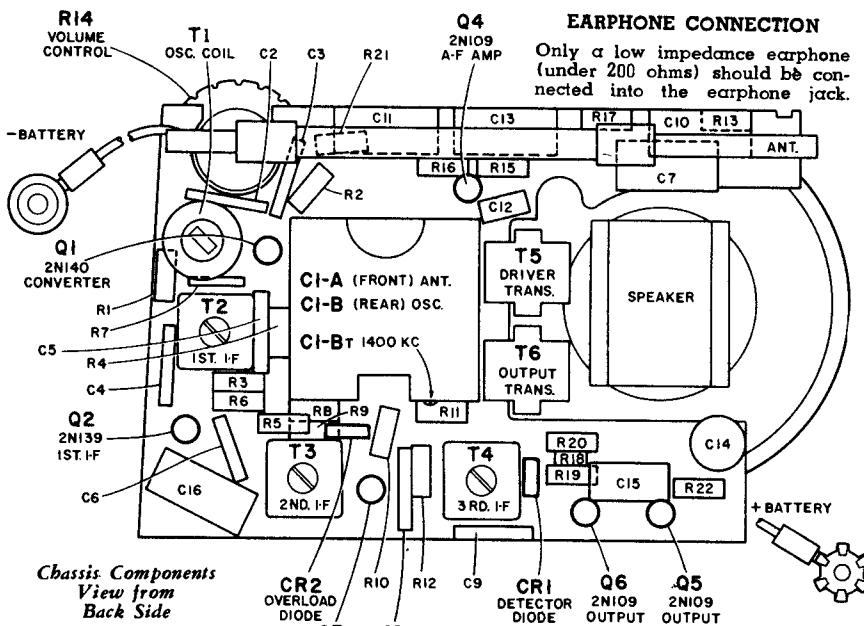

**Test Oscillator**—For all alignment operations, connect the low side of the test oscillator to the "common positive" wiring and keep the oscillator output as low as possible to avoid AVC action.

Step	Connect High Side of Sig. Gen. to —	Sig. Gen. Output	Dial Pointer Setting	Adjust for Max. Output
1	#2 terminal of ant. assembly L1	455 kc	Quiet point near 1600 kc	T4 3rd I-F T3 2nd I-F T2 1st I-F
2				Repeat Step 1
3	Short wire placed near antenna for radiated signal	1400 kc	1400 kc rock gang	trimmer* C1-B (osc.)
4		600 kc	600 kc rock gang	T1 osc. coil
5				Repeat Steps 3 and 4

\* Oscillator trimmer is located on bottom of gang.

## EARPHONE CONNECTION

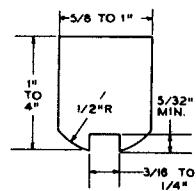

Only a low impedance earphone (under 200 ohms) should be connected into the earphone jack.

## Production Changes

1. R4 was 1000 ohms.  
R5 was 220 ohms.
2. C9 was .03 mf.  
C12 (.005 mf.) removed—it was connected from collector of Q4 to gnd.

C16 (45 mf.) was a wire-in type of capacitor in early production. It may be either a wire-in type or upright type in late production.

MATERIAL—STEEL OR BRASS  
THICKNESS OF 256 COIN.  
Tool Required for Removal of  
Chassis Mounting Nut

## SERVICE PROBLEMS AND REMEDIES

**Distorted Only On Weak Stations Or Only  
On Strong Stations**

When distortion is present and varies with the strength of the station signals, it indicates an abnormal condition in the circuit of those transistors whose bias is AGC controlled.

Distortion only on weak stations is most often due to unsatisfactory operation of the detector. The diode should have a slight initial forward bias. Check for presence of this bias voltage, check to see that polarity does not reverse with signal and that AGC voltage with signal is of proper polarity (base to emitter voltage should decrease with increase of signal).

Distortion on strong stations indicates that the transistors are being driven to cutoff by a strong AGC voltage. An overload diode is used to reduce the gain of an IF circuit only on strong signals. Check terminal voltages and the overload diode. Transistor radios will not handle large variations of signal as well as vacuum tube radios, and it may be that on excessively strong signals the best solution is to turn the radio so that the antenna will pick up less signal.

**Regeneration**

An IF transistor having exceptionally high gain may cause regeneration on weak signals. A possible correction for this difficulty is to interchange the two IF transistors—realignment is advisable after any change of transistors in the IF circuit.

If a type 2N140 transistor is used in place of a type 2N139 transistor, regeneration may occur. Check for use of correct type of transistor.

Two specific types of regenerative squeal have been found in the Transistor Six. The first type in which the audible sound can be controlled by the volume control has had several causes which were as follows:

1. High internal battery resistance. A new battery corrects the trouble.
2. High resistance riveted connections at battery leads on printed board. This trouble can be overcome by soldering the rivets to the printed wiring.
3. High resistance connections at chassis mounting spacer. This condition is evidenced by a change in the frequency and intensity of the squeal when the tuning condenser mounting screws are first loosened and then tightened. The spacer and the mounting screws are in the tuning condenser "ground" circuit and electrolytic action between the copper wiring and the die-cast zinc spacer results in corrosion and high resistance joints. A 3-point wire jumper should be soldered between the three copper areas at the tuning condenser mounting screws. The spacers now being used are copper plated and can be soldered to the wiring.
4. Stripped tuning condenser mounting screw. The third tuning condenser mounting screw is also used as part of the tuning condenser "ground" circuit. The screw must be long enough to hold securely in the condenser and yet not long enough to touch the tuning condenser plates.
5. Rosin joint at tuning condenser mounting screw. The third tuning condenser mounting screw mentioned above is soldered to the printed wiring. Some cases of poor soldering have resulted in rosin joints.
6. The mounting lugs of IF transformers T3 and T4 are used for ground interconnections. Loose rivets can result in intermittent regeneration. Solder a jumper wire between the two mounting lugs of each can.

**No Signal**

In cases of "no signal," the first step is to check battery voltage with set turned on. New batteries are 9 volts, but transistor radios will operate on batteries as low as 6 volts. If the battery is O.K., check terminal voltages. There can be short-circuits in transistor radios just as in any other radio. One significant difference is that in a transistor radio, there is insufficient power to burn a resistor.

Transistors have no filaments to burn out, but lead wires can be broken. Battery leads and phone jack leads are the most likely source of such trouble. Transistors themselves should be the last items suspected.

**Weak RF/IF Signal**

Transistor life in normal service has no known limit; service deterioration is so negligible as to be dismissed without further thought.

In all cases of RF/IF low sensitivity, first check terminal voltages. Although voltages may vary widely without greatly affecting stage gain, the voltages should all have the same proportion of variation. The bias voltages are the most difficult to measure but must not be neglected. A transistor having a normal "forward" bias of 0.15 volt will have a slight decrease in gain when operating with a bias of 0.12 volt but may have a great decrease in gain when operated with a bias of 0.10 volt. If a large voltage discrepancy is found it will be necessary to remove transistors before making resistance measurements in localizing the trouble.

Where a transistor stage shows low gain, shunt each bypass capacitor in that stage with another capacitor to detect open capacitors.

Alignment should be checked in all cases of low RF/IF sensitivity. There is only one core to each IF transformer but in some cases two peaks may be reached, one peak being higher than the other. If a transformer can not be peaked, it may have to be replaced — first check transformer terminal connections. The following are alignment suggestions:

1. IF transformer will not peak at 455KC — may be either defect in transformer or defective transistor (IF or converter) — try replacing transistor before changing transformer. An open bypass capacitor in the circuit of that transformer could give an unsatisfactory peaking condition.
2. IF transformers may be peaked incorrectly — maximum gain is obtained when cores are peaked at the "earliest in" peak.

Other possibilities of low RF/IF sensitivity are as follows:

1. Incorrect transistor—if type 2N139 is used in place of specified type 2N140, conversion gain will be down and oscillator section may fail to operate when battery voltage is down slightly.
2. Resistor value change in oscillator or converter stage — measure oscillator a.c. voltage at Q1 base (should be 0.20 to 0.70 volts p-p) — measure d.c. voltages — remove transistors and check resistors in converter circuit; if transistors are soldered in, unsolder one end of suspected resistor and measure without removing transistors.
3. Detector diode reversed — output is down slightly. Check by noting polarity of AGC voltage at the diode source. AGC line voltage at the diode will become more positive (or less negative) in respect to circuit ground with signal increase.

**Audio Distortion**

One type of audio distortion is regeneration due to low capacity filters and/or high resistance joints.

Because the output transistors are in a "Class B," circuit, even a small change in bias may result in distortion. The no-signal emitter or collector current of each of the output transistors should be 1.5 to 2 mA with a new battery. A bias voltage of -0.1 v. is required at that current drain.

Negative feedback is used to reduce distortion, the feedback resistor R22 is 82K. If the resistor is connected to the wrong output collector, the distortion would be increased instead of decreased. This tells us that the YEL. and GRN. leads of the driver transformer must not be interchanged and neither should the BLUE and RED leads be reversed. Some transformers had incorrect color coding.

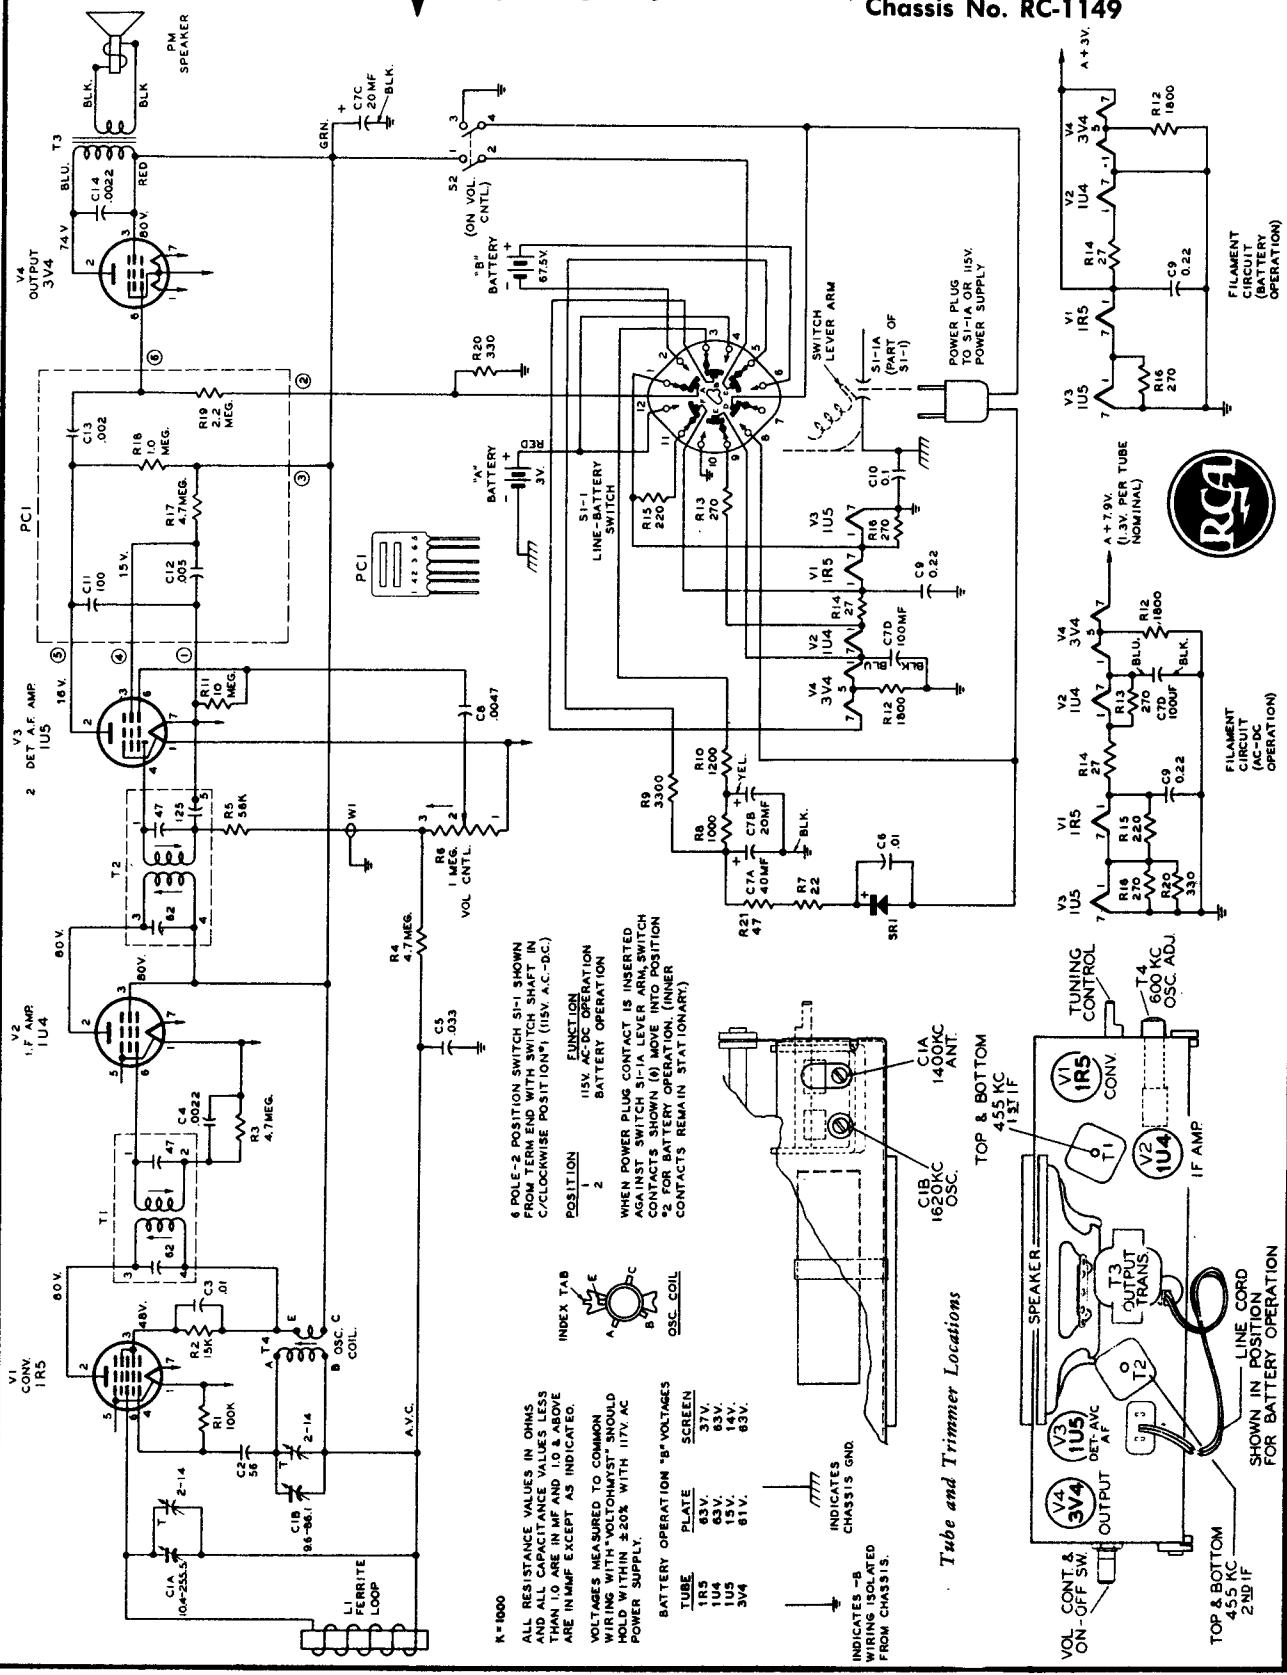

A simple case of low output and distortion has resulted from one pin of one output transistor being bent at right angles and not in its socket; the other two pins held the transistor in place.

In factory production, selected pairs of transistors are used for Class "B" output. Mismatched transistors will result in some distortion, this may or may not be noticeable during listening. Transistors may be matched by injecting an audio signal at the volume control and measuring the audio signal from each output collector to "ground." Matched transistors will give matched output signal.

## MODELS 9-US-5H, 9-US-5KE

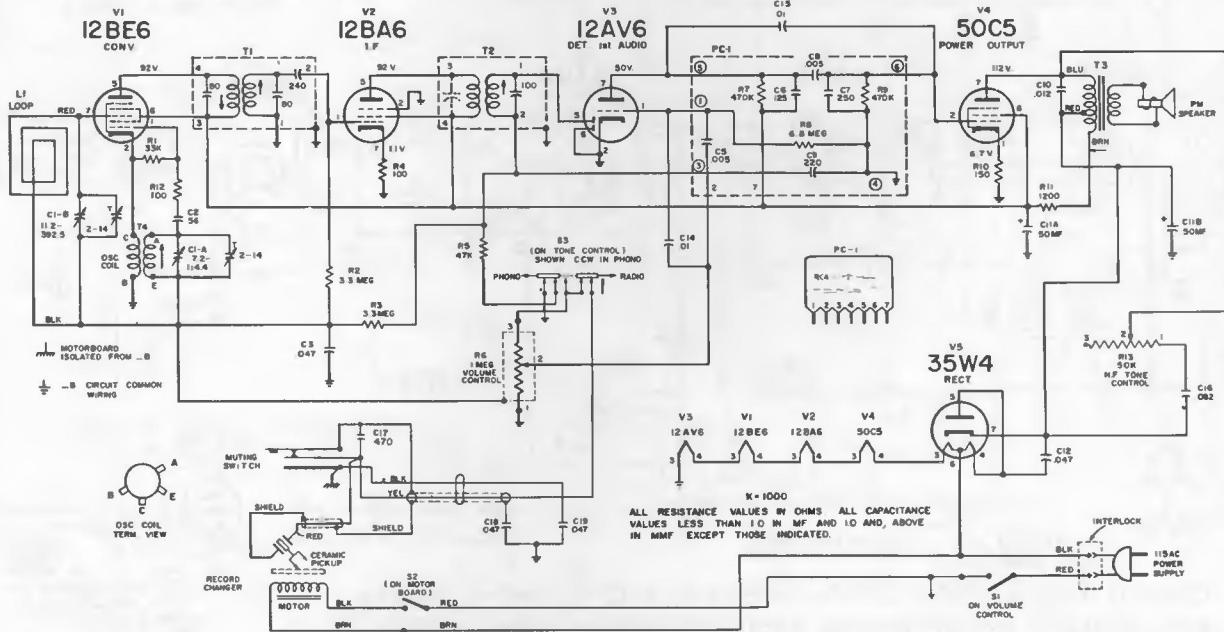

Chassis No. RC-1170A

### REMOVAL OF CHASSIS

1. Remove two screws at ends of chassis compartment panel.
2. Pull on attachment cord to separate cord from interlock contacts which are attached to the cabinet.
3. Unsolder three speaker leads and two loop antenna leads.
4. Unsolder record changer audio leads (yellow, black and shield).
5. Unsolder two record changer power leads and interlock leads from terminals at rear edge of circuit board.
6. Pull knobs off (volume, tone/switch, tuning).
7. Remove two nuts which hold chassis mounting bracket to front baffle board.
8. Remove two screws at rear edge of circuit board.

Step	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12BA6 I-F grid through .01 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	T2 (top) 2nd I-F trans.
2	Stator of C1-B through .01 mfd.			T1 (top and bottom) 1st I-F trans.
3		1,620 kc	Gang fully open	osc. trimmer C1-A
4	Short wire placed near loop to radiate signal	1,400 kc	1,400 kc signal	ant. trimmer C1-B
5		600 kc	600 kc signal	osc. coil T-4 (rock gang)
Repeat steps 3, 4, and 5

## 9-XL-1 SERIES

Chassis No. RC-1167A

### TO REMOVE BACK COVER

- Loosen screw at bottom-center of back cover and move slide upward out of slot in cabinet.
- Tilt outward to free interlock contacts, then drop from top grooves.

Avoid strain on loop connections.

### REMOVAL OF CHASSIS

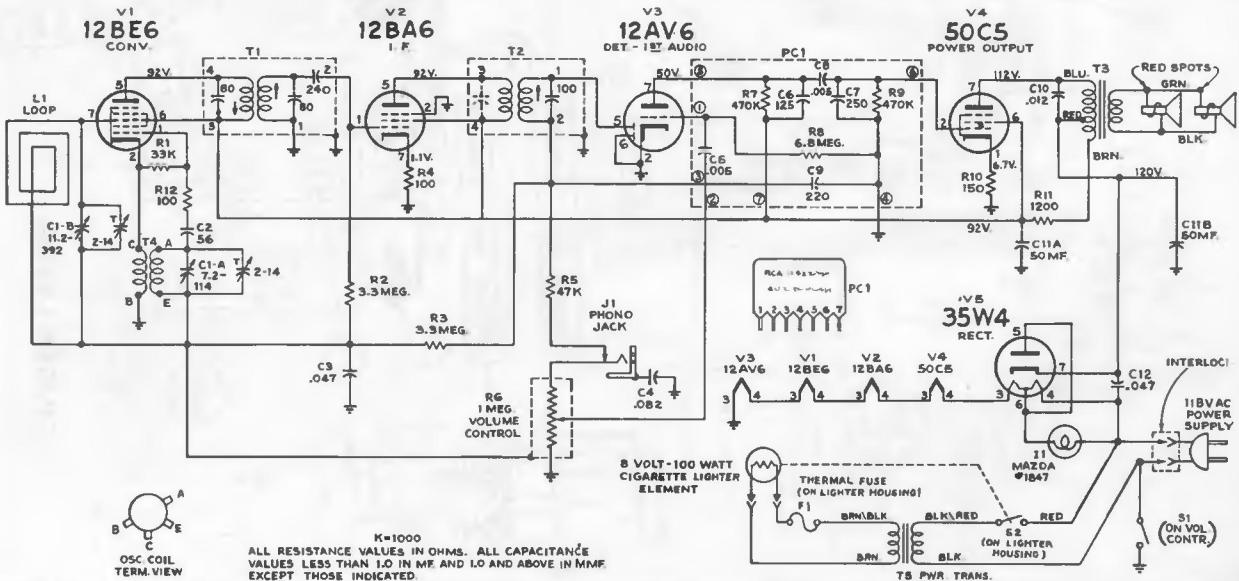

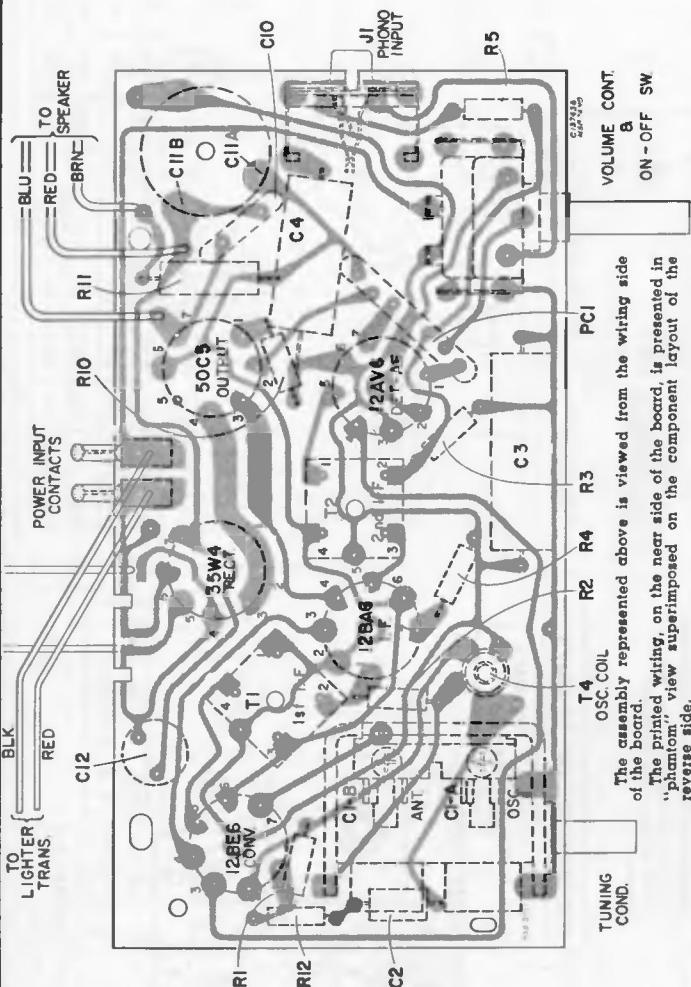

- Pull off volume control and tuning knobs.
- Remove back cover.
- Remove two screws holding dial assembly to cabinet.

### LEAD DRESS

- Leads from the chassis to the speaker should be dressed between the electrolytic capacitor and the left end of the cabinet.

### ALIGNMENT PROCEDURE

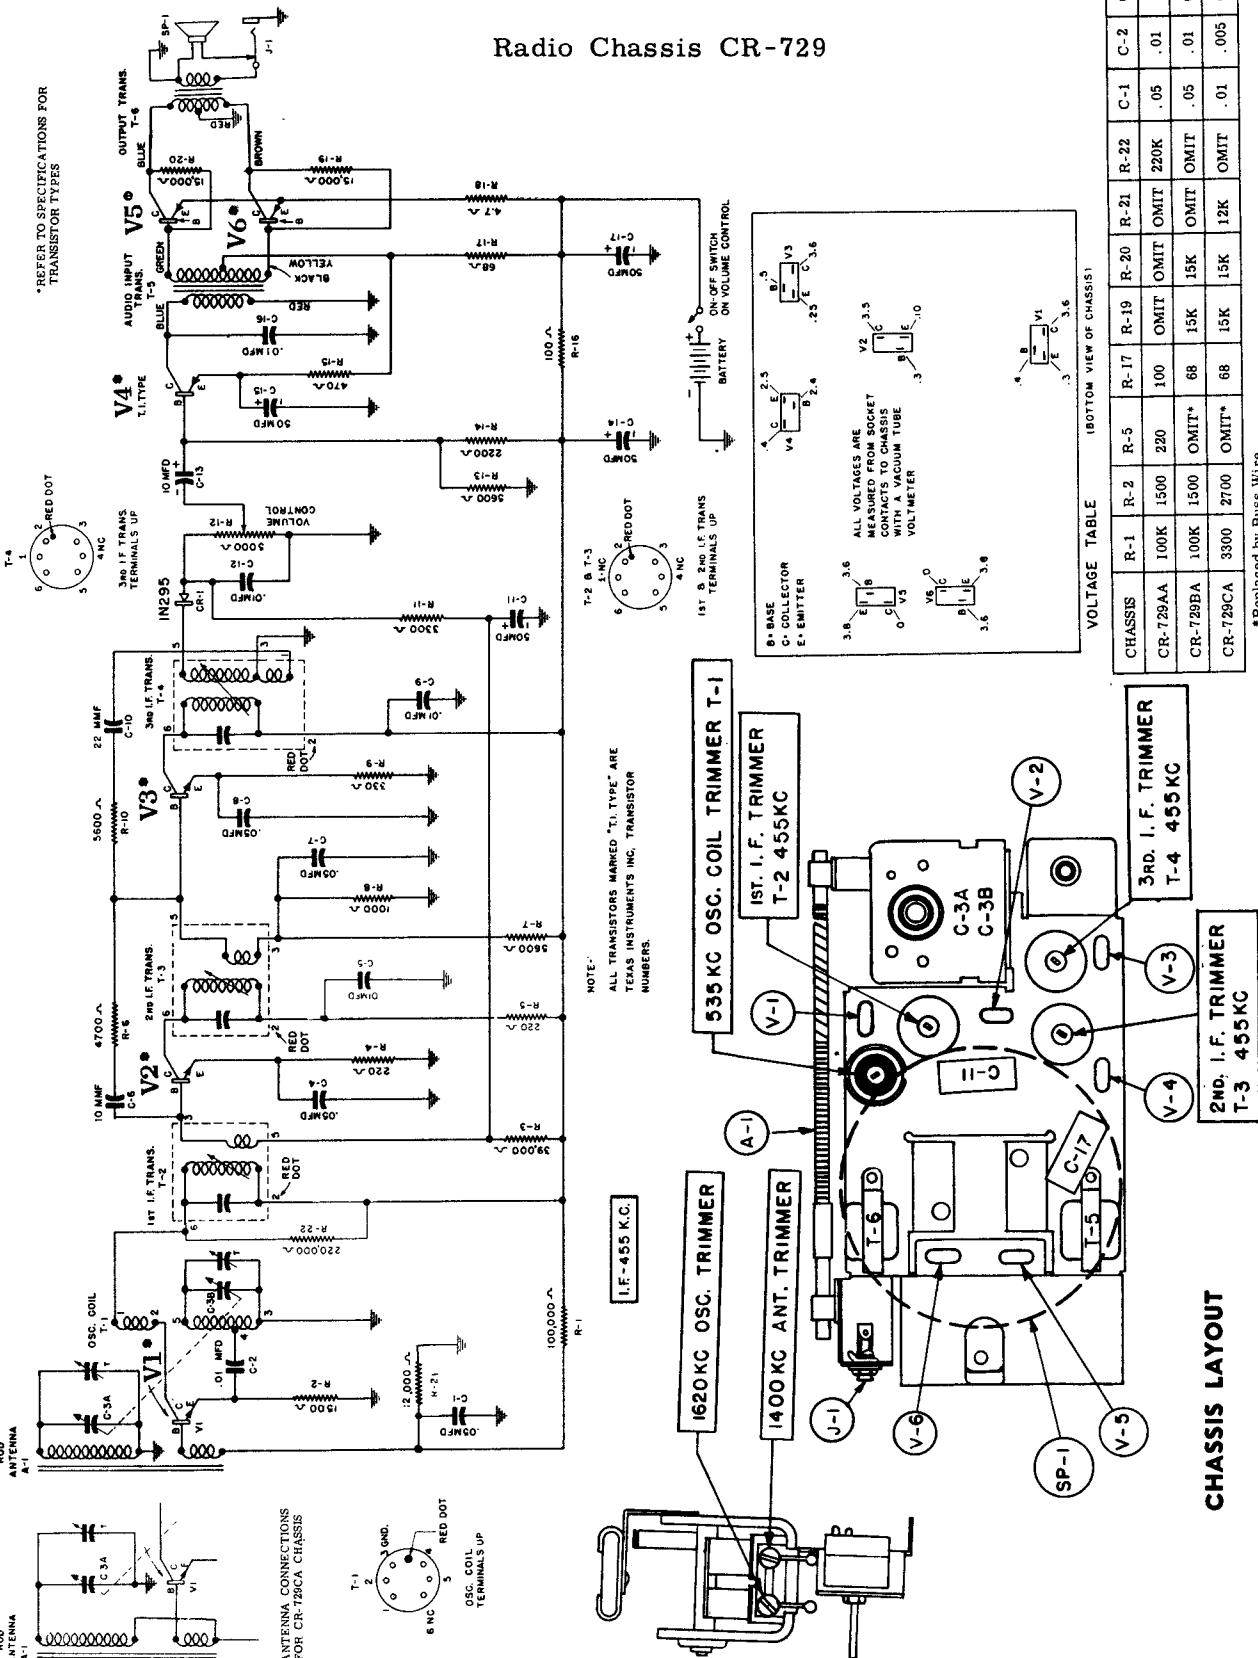

Step	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12BA6 I-F grid through .01 mfd. capacitor	455 kc	Quiet-point 1,600 kc end of dial	T2 (top) 2nd I-F trans.
2	Stator of C1-B through .01 mfd.			T1 (top and bottom) 1st I-F trans.
3		1,620 kc	Gang fully open	osc. trimmer Cl-A
4	Short wire placed near loop to radiate signal	1,400 kc	1,400 kc signal	amt. trimmer Cl-B
5		600 kc	600 kc signal	osc. coil T-4 (rock gang)

**PRINTED BOARD REMOVAL**

1. Remove the front control knobs.
2. Remove the screw located above the tuning shaft (this screw mounts the printed circuit board to the front of the cabinet).
3. Remove the two self-tapping screws from the back of the cabinet.
4. Remove the back cover. Be careful not to break the two leads from the antenna loop to the chassis.
5. Loosen the metal band securing the speaker leads to

- the speaker to provide slack in the leads.
6. Carefully slide the printed board out from the rear of the cabinet (the printed board is held secure in the cabinet by a top and bottom channel molded into the cabinet).
7. Use a conventional TV AC interlock line cord to power the radio while servicing.

## BOARD REMOVAL

1. Remove the screw located in center of the tuning knob. Turn the dial to the low frequency end and grip the tuning knob with one hand. Remove the screw by turning it in a counter clockwise direction. Do not cause any undue strain on the tuning capacitor.
2. Remove back of cabinet by loosening coin-slot screw on back. Remove the  $\frac{1}{4}$ " self tapping screw located at tuning condenser end of board.
3. Hold radio in the palm of the hand with the open back side up. Grip the board with the other hand and slide it down towards the tuning capacitor end of the cabinet, until the upper end of the speaker bracket is free of the plastic lip. Now raise this end of the bracket over lip and slide it out of the cabinet.
4. To insert the board into the cabinet use the reverse procedure, being careful to lock the speaker bracket under both recesses provided in the cabinet front.

Models H-621P6, H-622P6,  
Chassis V-2296-1**BOARD REMOVAL**

1. Remove the two control knobs.
2. Remove the three self tapping screws which secure the printed board to the interior of the cabinet.
3. Disconnect the two pronged plug from either the receptacle in the top cover or from the battery pack.
4. The radio chassis may now be removed from the cabinet for servicing without unsoldering the speaker leads.
5. When inserting the radio chassis into the cabinet use the reverse procedure, being careful to insert the unreinforced side of the printed board into the grooves on the inside front of the cabinet and then secure with self-tapping screws.

## CIRCUIT INFORMATION

The V-2500-1 amplifier circuit, used in models HF100BN and HF101BN, is shown in figure 2.

An audio signal of about .7 volts is amplified to about 6 watts through a straightforward amplifier circuit. A 12AX7 serves as audio amplifier and phase inverter to drive the 6V6 push-pull output tubes. This output stage is operated class AB1.

Degeneration, for improved fidelity, is obtained through the use of unbypassed cathode resistors and the inverse feedback loop through R116.

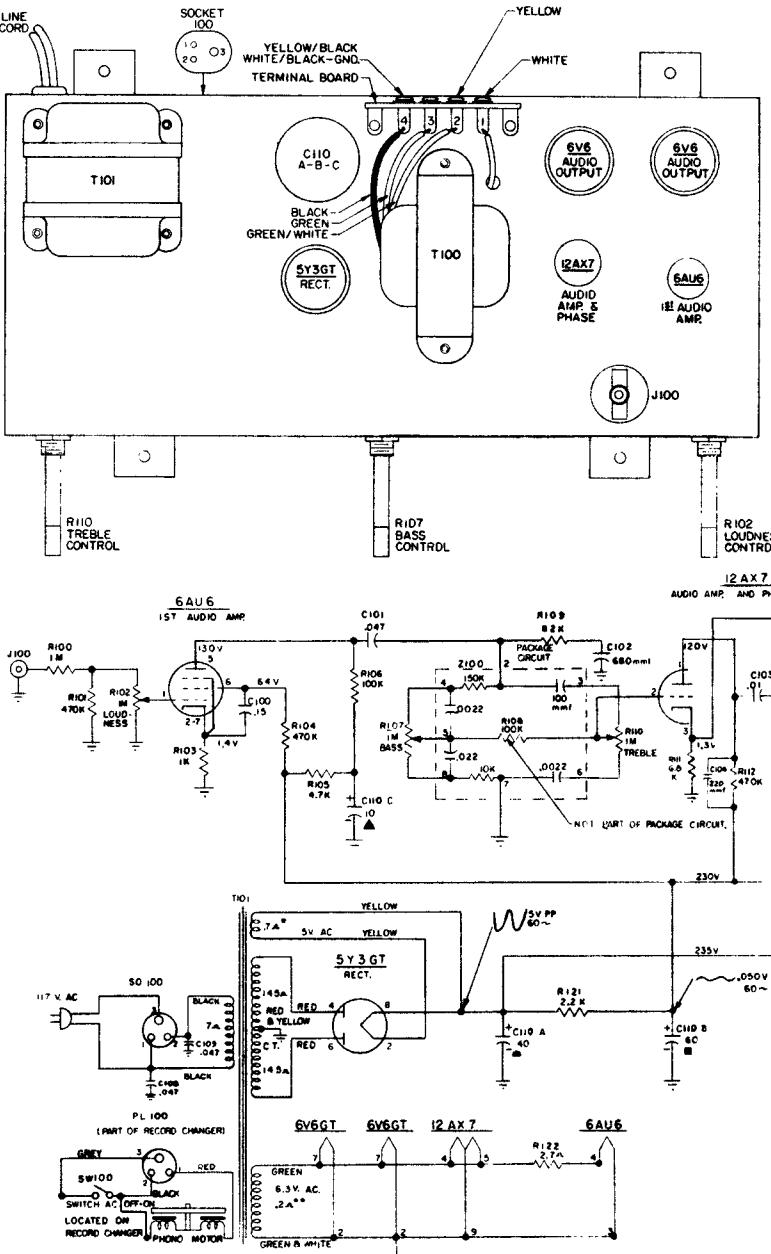

A 2.7 ohm resistor is used in series with the 6AU6 heater to reduce hum.

The impedance of each speaker voice coil is 12.8 ohms. If a replacement speaker is required, use the correct Westinghouse replacement speaker listed in the parts list.

When operating the amplifier with speakers disconnected (during tests), connect four 50 ohm, 2 watt resistors in parallel across output terminals 2 and 4.

The function of C107 is to pass only high frequencies to the parallel high frequency speakers.

AC input (to the power transformer primary) is connected to 1 and 3 of the socket, SO 100; the AC on-off switch is located on the record changer.

## VOLTAGE GAIN MEASUREMENTS

An audio signal generator and VTVM are required for voltage gain measurements. To measure over-all amplifier gain, proceed as follows: 1) Disconnect speaker. Connect four 50 ohm, 2 watt resistors in parallel across terminals 2 and 4. 2) Set loudness control, R102, to maximum loudness. 3) Set bass control, R107, and treble control, R110, to mid-range. 4) Connect generator output to J100. Set generator for 1Kc, at about .7 volts output. 5) Connect VTVM across output terminals 2 and 4. Approximate correct voltage reading is 8 volts.

Chassis V-2501-1

## AMPLIFIER CIRCUIT INFORMATION

### Input

Two input jacks, J100A and J100B, are provided. SW100 selects the input signal fed to the 12AU6 1st audio amplifier. The output from the phono pick-up is fed to J100B; other audio signals may be fed to J100A.

### 1st audio amplifier

To minimize hum, the first audio amplifier heater receives direct current, fed from the cathode circuit of the push-pull output stage. R101 is unbypassed to provide degeneration for improved fidelity.

### Equalizer

Package circuit Z101 contains the record equalization capacitors and resistors. Equalization is selected by SW101 to modify the amplifier response, adapting the response to the type of record being played. Equalization positions are as follows:

R1AA: Compensates for R1AA recording curve.

LP: Compensates for standard 33 1/3 RPM records.

EUR: In this position, Z101 is switched out of the circuit. European records usually require this setting.

78: Compensates for older 78 RPM records.

### Tone controls

Except for R106, the tone control fixed resistors and capacitors are contained within packaged circuit Z100. Tone control characteristics are as follows:

BASS: Provides up to 20 db boost at 40 cycles.

TREBLE: Provides up to 15 db boost at 15,000 cycles.

### Audio amplifier and phase inverter stage

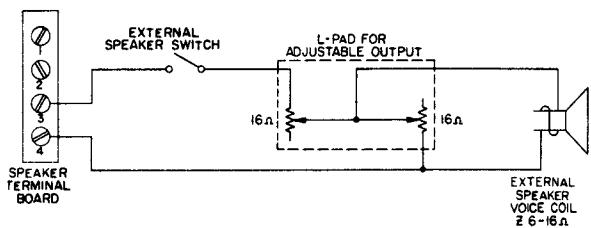

A 12AX7 is used as audio amplifier and phase inverter. Inverse feedback voltage is fed to the cathode of the audio amplifier (pin 3) to provide additional improvement in fidelity and stability. Grid drive to one 6L6 output tube is fed from the plate (pin 6); grid drive to the other 6L6 is fed from the junction of R111 and R112 in the cathode circuit of the phase inverter.

### Audio output stage

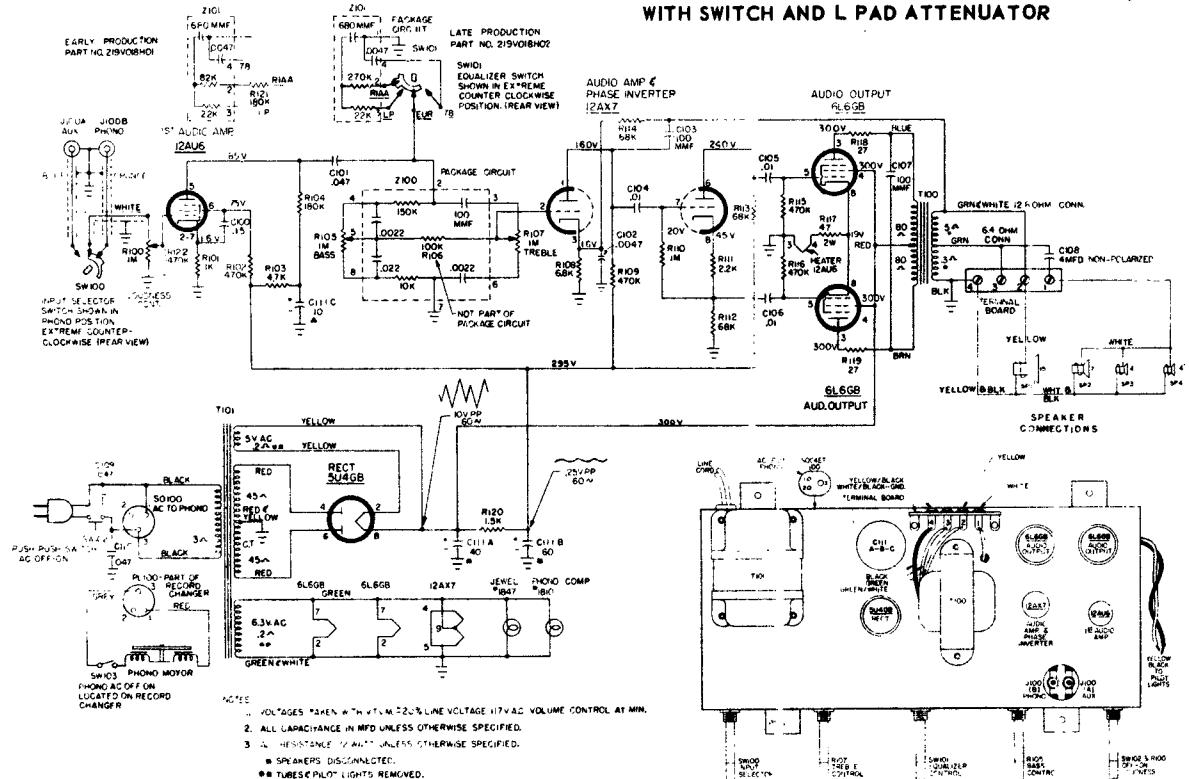

The 6L6 push-pull audio output tubes operate class AB1. R118 and R119 prevent oscillation (ringing). The 12AU6 heater serves as part of the common cathode resistor for the 6L6 tubes. (This circuit arrangement provides DC for the 12AU6 heater).

### Output circuit

Normal DC resistance across the primary and secondary of T100 is shown in figure 1. Output impedance, between terminals 2 and 4 is 12.8 ohms; impedance between terminals 3 and 4 is 6.4 ohms. C108 is the cross-over capacitor which passes the high frequencies to the paralleled high frequency speakers.

## ZENITH RADIO MODEL AP7F

## MODEL AP8J

**ZENITH RADIO Chassis 7AT42 & 7AT42Z1**

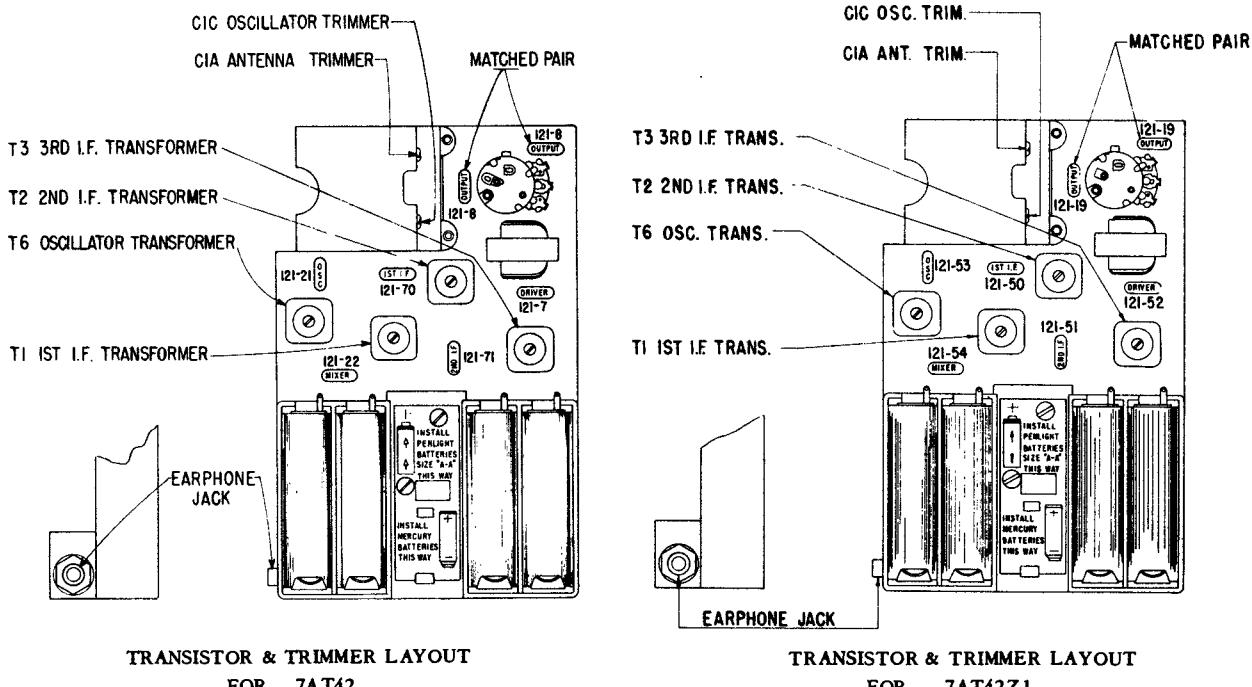

Model "Royal 300" (Continued on page 183)

**CHASSIS IDENTIFICATION**

The "Royal 300" seven transistor portable has been produced with two basic chassis. This expedient was necessary to enable us to produce sufficient quantities by using transistors from several sources. Both chassis have the chassis number stamped on them as well as a color identifying code on the battery compartment just above the battery installation instruction label.

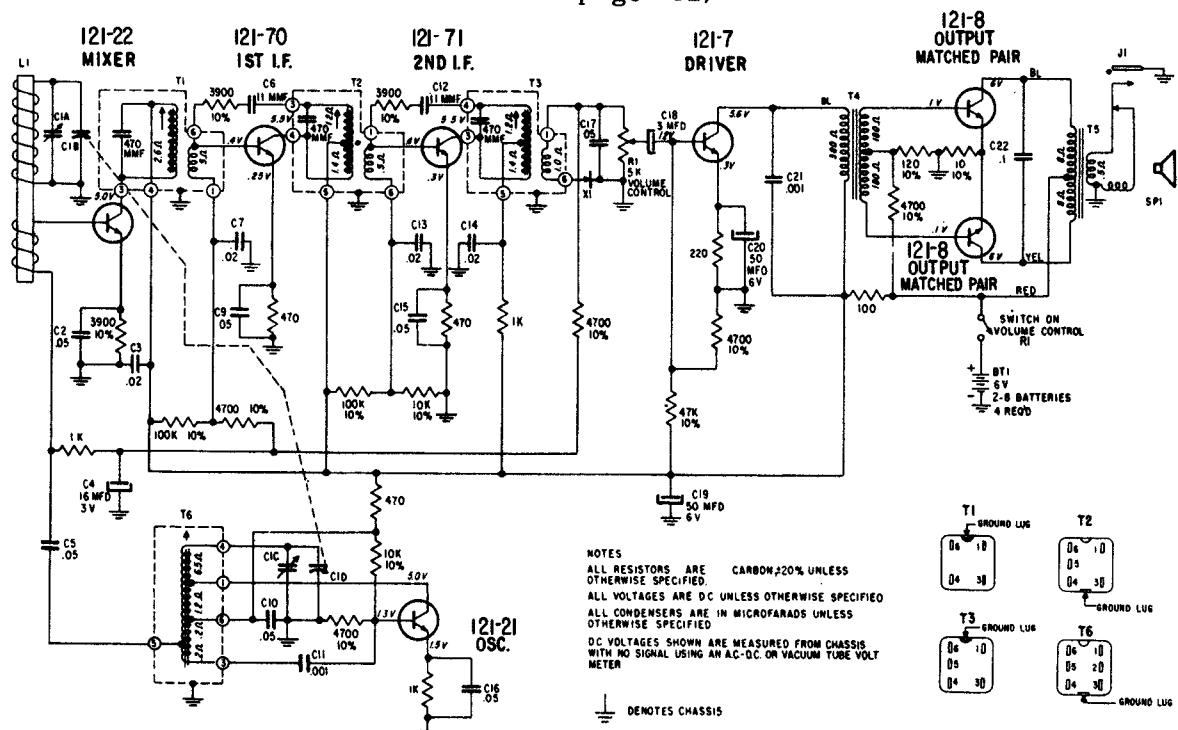

The 7AT42 chassis uses transistors manufactured by Sylvania. The 7AT42Z1 chassis uses transistors manufactured by Texas Instrument. In addition to this, both chassis have individual transistor layout labels. The color of the printing on these labels conforms respectively to the color dot on the chassis. The accompanying chart gives all the necessary information on chassis number, color dot, transistor layout labels, transistor numbers, Zenith part number, RETMA part number (where available), transistor supplier, etc.

Chassis	Chassis Color Dot	Transistor Layout Label Color	Part No.	Mixer	Osc.	1st. I.F.	2nd I.F.	Crystal Diode Detector	Driver	Output-Output	Supplier
7AT42	Green 102-3498	Green 102-3498	Zenith RETMA Type	121-22 2N194 NPN	121-21 2N193 NPN	121-70 NPN	121-71 NPN	103-19 1N87G	121-7 2N35 NPN	121-8 2N35-2N35 Matched Pair NPN NPN	Sylvania

**ZENITH RADIO MODEL "ROYAL 700L" CHASSIS 7AT43 & 7AT43Z3****TRANSISTOR & TRIMMER LAYOUT FOR 7AT43****RESISTANCE MEASUREMENTS**

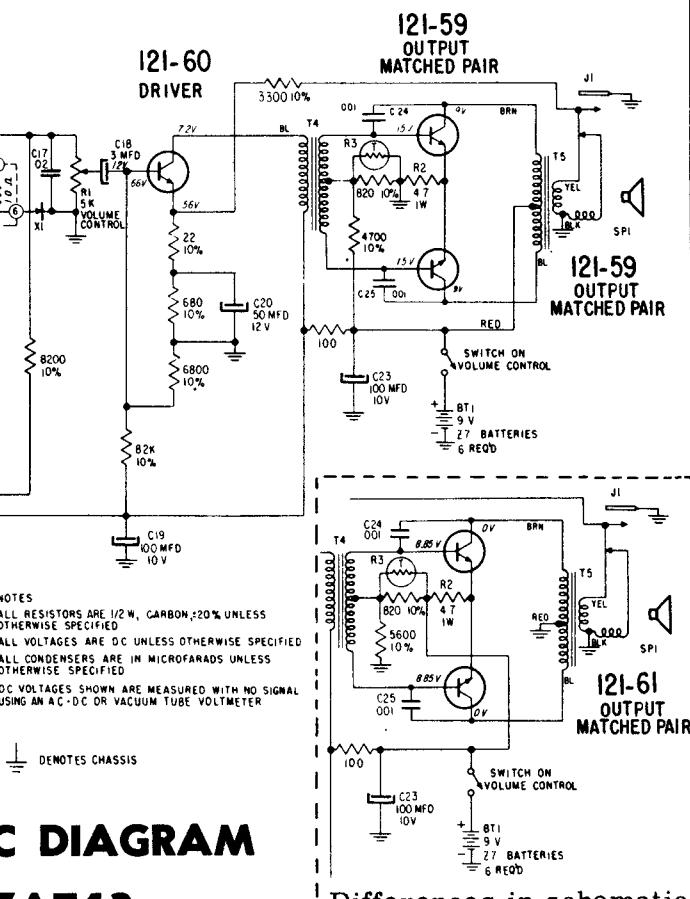

When making resistance measurements in the circuit, it is most important to remove the transistors in the circuit under test otherwise readings obtained will be incorrect. This is the direct result of a transistor acting as a diode.

In addition to this, it is important to know the internal battery voltage of the ohm meter as well as battery polarity of the meter leads since incorrectly placing ohm meter leads across an electrolytic condenser with low working voltage may damage the capacitor due to excessive reverse current or excessive voltage.

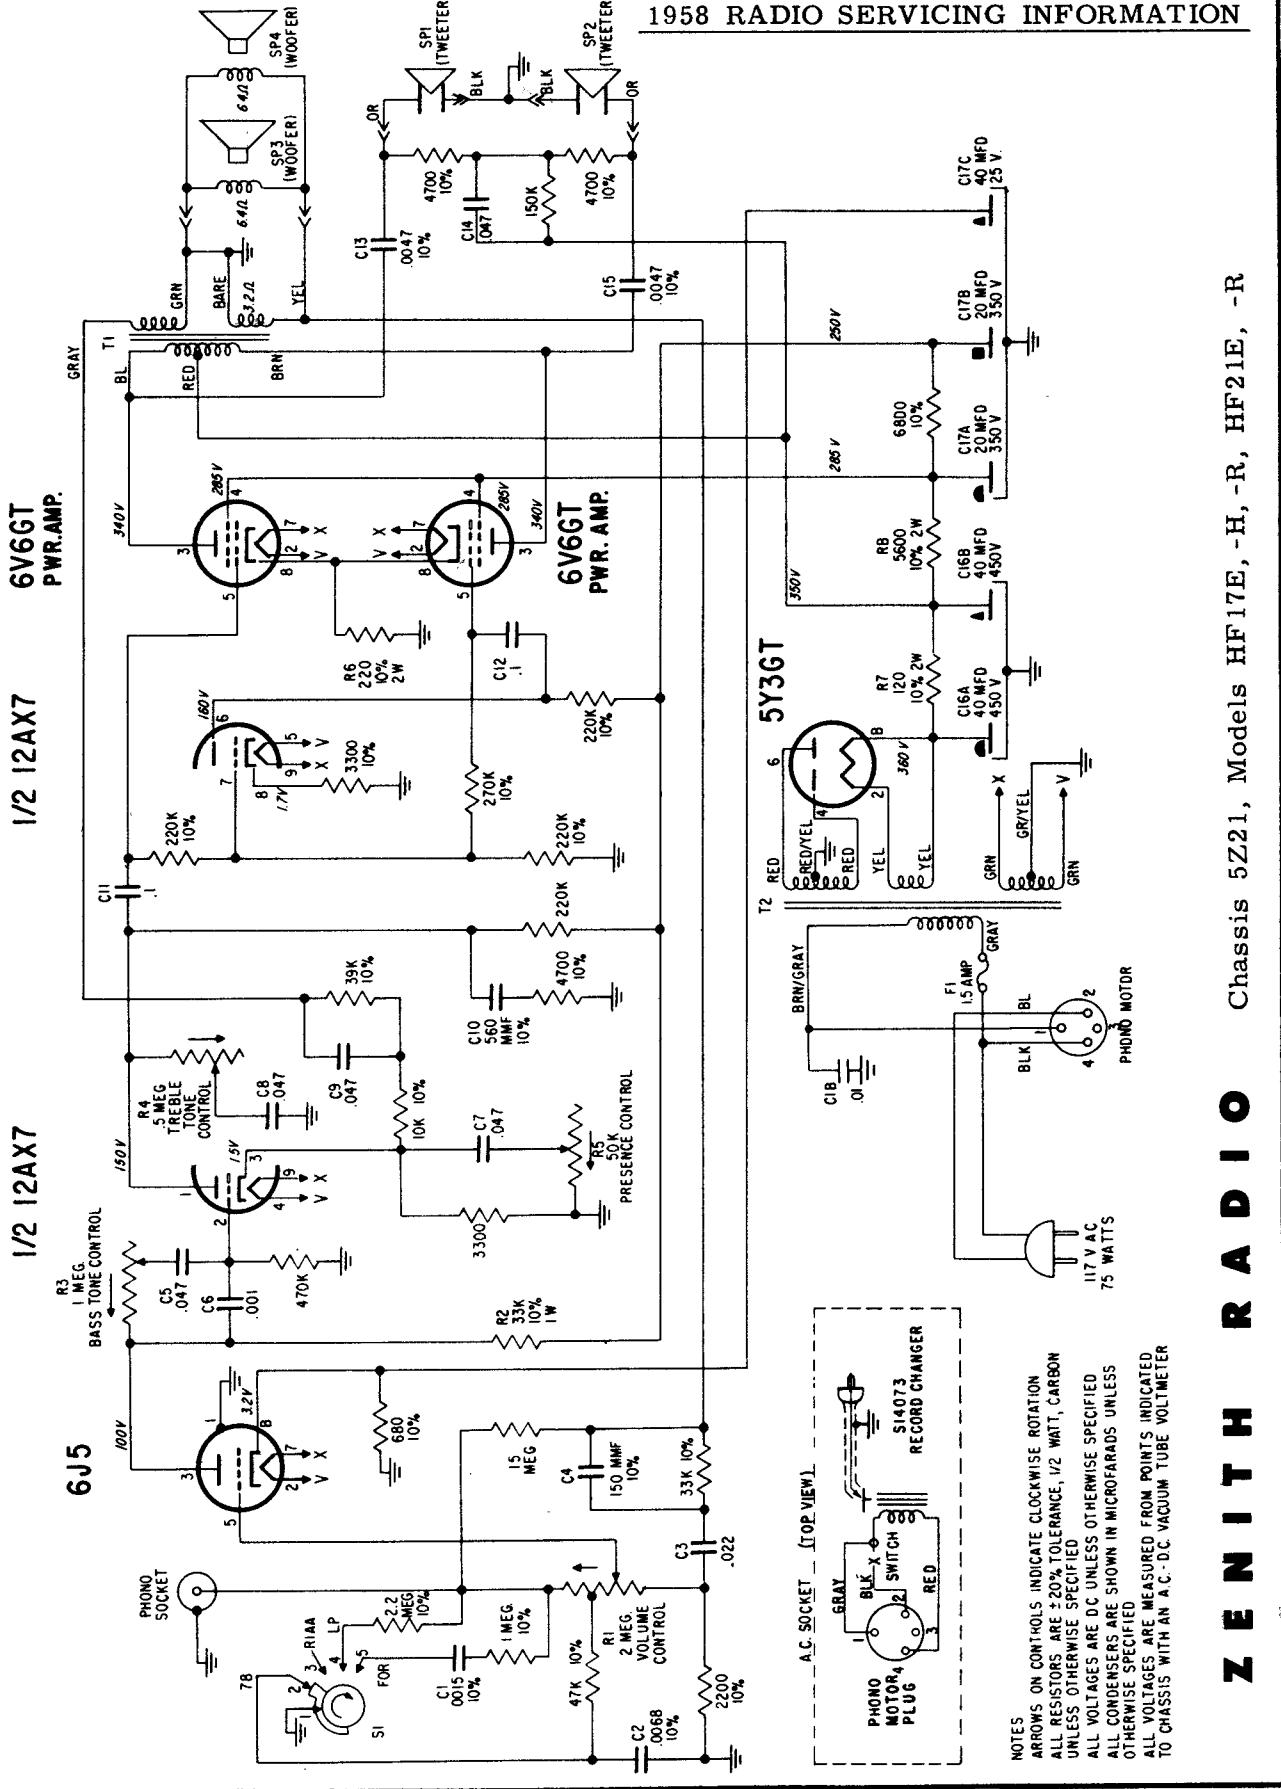

**VOLTAGE READINGS**

It is suggested that a VTVM with an excellent low range scale be used to measure all circuit voltages. All voltages indicated on the accompanying diagram have been measured under no signal conditions and a battery supply voltage of nine volts. Under these no signal conditions, a check can be made of the batteries. The total voltage should be nine volts.

Use alignment table on page 182 for this model also.

(See page 188 for circuit of 11A20, and page 190 for circuit of 11A21)

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.
