

# RADIOLA "257"

(Continued from facing page)

## OPERATING VOLTAGES.

The following measurements were made with a "1,000 ohms per volt" meter, and voltages are those existing between the socket contact indicated and chassis. The receiver was operating under "no signal" conditions from a 240 v. A.C. supply with all controls turned to their maximum clockwise position, with the exception of the wave-change switch which was set as desired. Those readings shown in parenthesis were made with the wave-change switch in both the "S/W.1" and the "S/W.2" positions, whilst the alternative readings were made with the receiver on "B/C"; all other readings are unaffected by the position of the wave-change switch.

**6K7, R.F. Amplifier:** Plate, 255 v. (250 v.); screen, 100 v. (90 v.); cathode, zero. Plate current, 4.5 mA. (5.5 mA.).

**6L7, Pentagrid Mixer:** Plate, 255 v. (250 v.); screen, 100 v. (90 v.); cathode, zero. Plate current, 2 mA. (2.5 mA.).

**6J7, Oscillator:** Plate, 210 v. (230 v.); screen, 200 v. (190 v.); cathode, zero.

**6K7, 460 KC., I.F. Amplifier:** Plate, 255 v. (250 v.); screen, 100 v. (90 v.); cathode, zero. Plate current, 4.5 mA. (5.5 mA.).

**6H6, Detector and A.V.C. Rectifier:** Detector plate returned to chassis through T11, R11, and R12 (when "Radio/P.U." switch is on "Radio")); cathode, zero.

**6H6, A.V.C. Delay and Muting Diode:** A.V.C. delay cathode tapped at junction of R24, R25 on "B/C.", and at junction of

R25, R26 on "S/W.1" and "S/W.2"; muting diode cathode taken through R19 and R18 to R20.

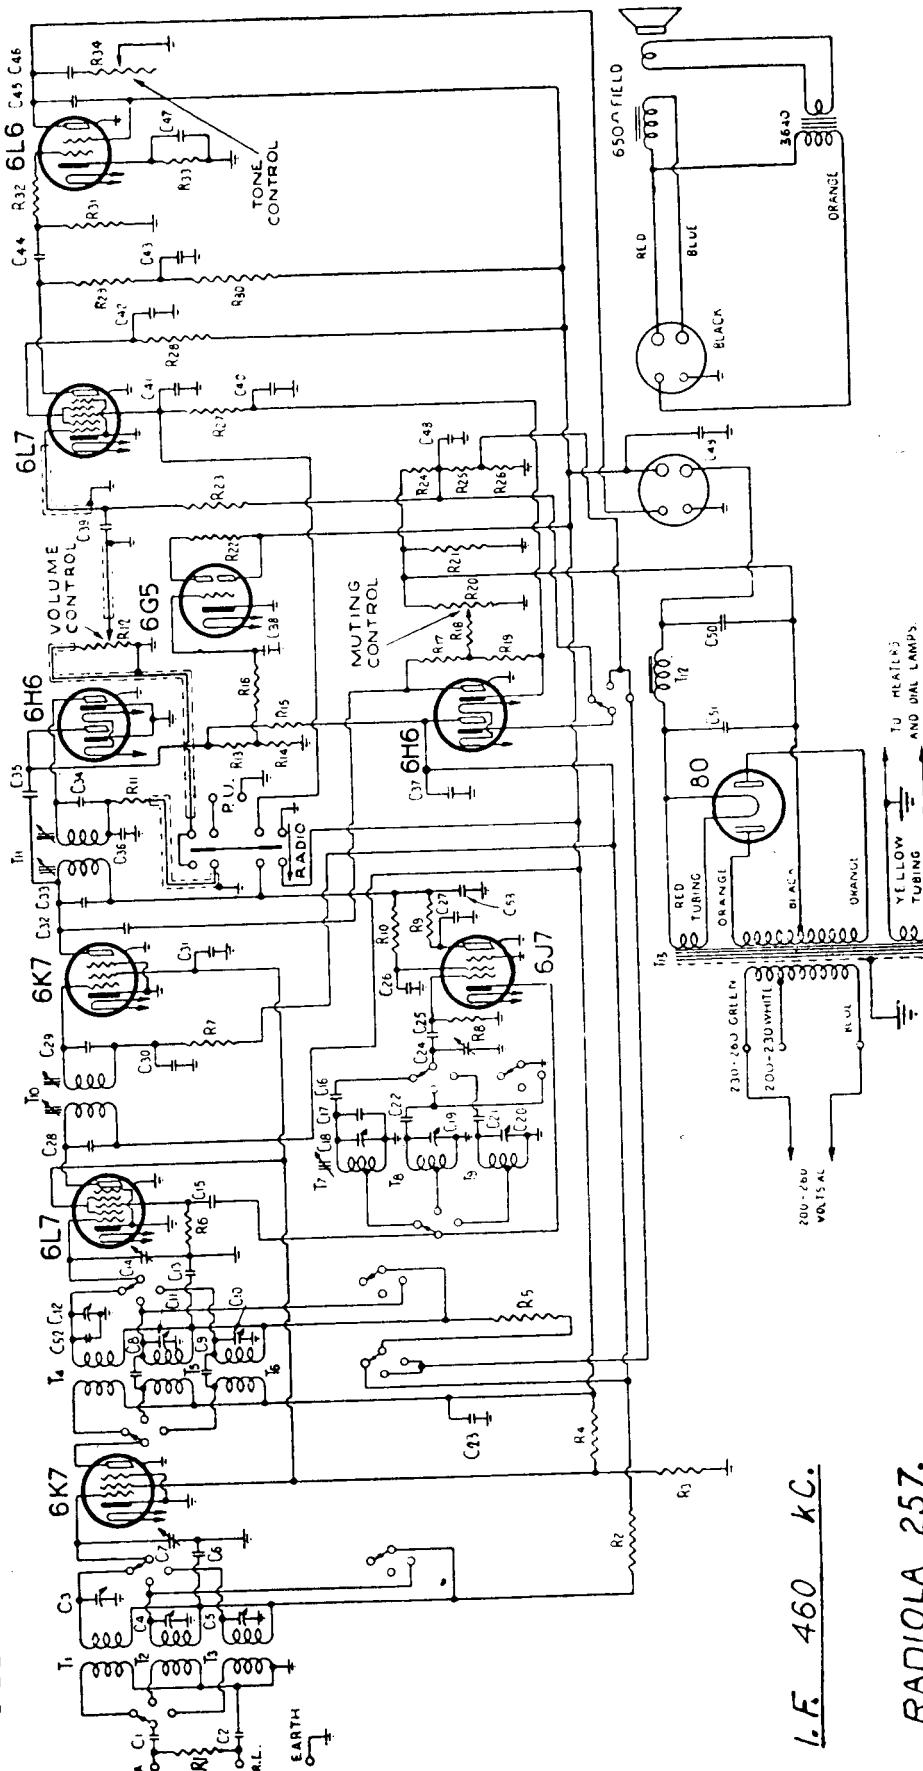

**6L7, A.F. Voltage Amplifier:** Plate, 75 v.; screen, 45 v.; cathode, zero. Plate current, 0.9 mA.

**6L6, "Beam" Power Output Tetrode:** Plate, 245 v.; screen, 255 v.; cathode, 15 v. Plate current, 70 mA.

**80, Rectifier:** A.C. volts per plate (measured from C.T. of transformer high-tension secondary), 380 v.; voltage drop across loudspeaker field, 80 v. Total current, 105 mA.

## RADIOLA 257 CIRCUIT DATA

# Radiola Model 257

## ELECTRICAL SPECIFICATIONS.

Voltage Rating	200-260 volts
Frequency Rating	40-60 Cycles
	(Special instruments made for other voltage and frequency ratings)
Power Consumption	95 watts
Tuning Ranges	(a) 1500-550 Kilocycles (b) 35-105 Metres (c) 13-39 Metres.
Intermediate Frequency	460 Kilocycles

## VALVES AND CIRCUITS.

6K7 R.F. Amplifier	6H6 Muting Diode
6L7 Converter	6L7 Audio Amp.
6J7 Oscillator	6L6 Output
6K7 I.F. Amplifier	80 Rectifier
6H6 Detector and A.V.C.	6G5 Tuning Indicator

## SOCKET VOLTAGES.

## MUTING SYSTEM

( See also pages 304 and 305)

The function of any muting device is to silence the receiver when tuning between stations, but at the same time it must not introduce distortion or impede the reception of a useful carrier. These conditions have been satisfied by the use of a 6L7 valve as A.F. amplifier, and also one section of a 6H6 duo-diode as control element in the muting system; the injector grid (No. 3) of the 6L7 is used to vary the mutual conductance of the valve, so that when a comparatively strong signal voltage (such as that due to the reception of a useful carrier) appears in the plate circuit of the 6K7, I.F. amplifier the receiver will function in the normal way, but when a comparatively weak voltage (such as that due to "noise" pick-up) appears, the injector grid reduces the mutual conductance of the 6L7 to zero, with the result that this "noise" will not reach the grid of the output valve. To adjust the "muter" the receiver should be tuned "off-station," and the "muting control" varied until all noise is reduced to a minimum or is stopped altogether. Under these conditions the negative voltage applied to the injector grid of the 6L7, A.F. amplifier is sufficient for plate current "cut-off" of this valve, so reducing its mutual conductance to a minimum; this means that any voltage applied to the signal grid of the 6L7 when in this condition will not be applied to the grid of the output valve, and the receiver will therefore remain silent. However, upon reception of a useful carrier, the voltage appearing at the plate of the 6K7, I.F.

amplifier is comparatively large and, by means of the coupling condenser C32, will cause an appreciable mean voltage to appear across the resistor R17, causing the muting diode anode to become positive with respect to its cathode. The resultant diode current will cause a voltage to appear across R19 in opposition to the negative bias applied to the 6L7 No. 3 grid from the "muting control." The reduction in the bias applied to this grid allows the valve to "un-block," and so any voltage applied to its signal grid will be amplified in the normal manner, and applied to the grid of the 6L6 output tetrode.
