SIMPLE SHORT WAVE CALIBRATION ADJUSTMENT.

The short wave calibration may be adjusted slightly, without removing the chassis from the cabinet for full alignment by adjusting the four cores, L19, L21, L23 and L25 after a station of known frequency is received.

The correct procedure is as follows:

- (1) Set the dial pointer so that calibration is correct on the medium wave band.
- (2) To adjust the calibration of the 22.3-17.7 Mc/s band, tune in the known station, and to shift the pointer position to the left, turn L9 clockwise or vice versa until the station can be tuned in at its assigned frequency.

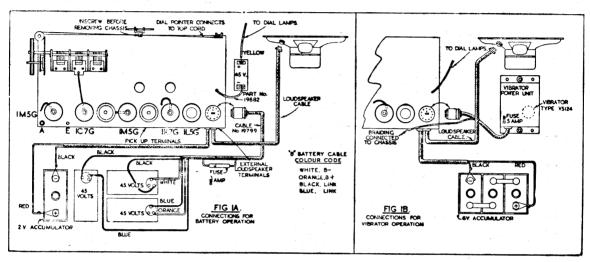

(3) The adjustments for the 19.0-15.0, 15.0-11.7, and 12.0-9.4 Mc/s bands are similar, using L21, L23 and L25 respectively.

VIBRATOR POWER UNIT No. 17770.

Operating from a 6 volt accumulator, the Vibrator Power Unit supplies the correct H.T. supply voltage for the receiver. It contains a plug in vibrator cartridge, stepup transformer, an efficient filter system and a 5 amp. fuse, which is located within the unit.

The unit is connected to the receiver by means of a cable and plug. See "Battery Connections" diagram.

To remove the vibrator unit from the cabinet, disconnect the cable from the receiver and unscrew the three holding screws which pass through the base of the cabinet.

BATTERY CONNECTION.

CHASSIS REMOVAL AND REPLACEMENT.

(1) Turn the Phono-Range Switch to the 22.3-17.7 Mc/s position and then remove three control knobs from the front of the cabinet. These knobs are each held by one set screw. To remove the two knobs at the side of the cabinet, proceed as follows:—

Table Model.

The knobs pull straight off. Do not loosen the set screw in the lower knob. If difficulty is experienced in removing this knob, refer to the label adhered to the inside of the cabinet for instructions.

Console Model.

The knobs are not removed, but the spindles to which they are attached are parted at the couplings within the cabinet.

- (2) Disconnect the loudspeaker and battery or vibrator cables.
- (3) Disconnect the dial pointer from the drive cord, first unscrewing the thumb nut.
- (4) Disconnect the sheathed cord, which actuates the band indicator on the dial scale. The cord is connected to the dial assembly at two points, the sheath to the top left-hand corner of the dial assembly (viewed from the

- rear) and the cord to the band indicator. Loosen the thumb screws at these points and carefully free the cord from the assembly.
- (5) The chassis is held in the cabinet by four bolts. Remove these and withdraw the chassis from the cabinet.
- (6) Replacing the chassis in the cabinet is a direct reversal of the above instructions, but care must be taken to connect the dial pointer to the drive cord as follows:—
 - (a) Turn the tuning control to bring the ganged capacitor plates into full mesh.
 - (b) Connect the dial pointer to the drive cord with the pointer in a position opposite the setting mark on the dial scale, which is approximately 1/4 inch to the right of the 540 kc/s calibration point.

"SERVICE WINDOW."

A "Service Window" is provided in the base of the table model cabinet. The "Window" is normally covered with a perforated grille fastened by four knurled nuts. With the grille removed, it is possible to perform most service operations without removing the chassis from the cabinet.

Measurements taken with 1,000 ohms per volt meter, no signal input, and volume control in maximum clockwise position.

ALIGNMENT PROCEDURE

Alignment should be necessary only when adjustments have been altered from the factory setting, or when repairs have been made to the tuned circuits. Climatic conditions should not seriously affect the receiver.

It is important to apply a definite procedure as given in the booklet, and to use adequate and reliable test equipment. Instruments ideally suited to the requirments are either A.W.A. Junior Signal Generator type 2R3911 or the A.W.A. Modulated Oscillator type J6726 and C1070*. An output meter is necessary with both these instruments, the recommended type having an output impedance of 15,000 ohms and a range of 5-3,000 milliwatts. The meter should be connected across the primary of the loudspeaker transformer, with the voice coil of the loudspeaker opencircuit. If the output meter used is one which does not impress a load on the anode circuit of the output valve, it will not be necessary to open-circuit the voice coil.

As the calibration of the band-spread requires great accuracy, it is recommended that an A.W.A. Crystal Calibrator type 6795 be used, after setting the oscillator calibration to check the accuracy of the signal generator. The crystal calibrator emits a modulated signal at intervals of either 100 or 1,000 Kc/s throughout the radio frequency spectrum, thus providing a series of fixed and equally spaced calibration points of known accuracy. When using this instrument, care should be taken to select the correct signal. With the crystal set at the 1,000 Kc/s position, a spurious image signal can generally be obtained by turning the tuning control of the receiver to a point approximately 100 Kc/s higher in frequency. This is a useful check as to whether a harmonic or spurious image is being tuned. If a crystal calibrator is not available, broadcasting stations of known frequency my be used as an alternative.

When using a signal generator or modulated oscillator, with the tuning of the receiver fixed, two frequencies can be tuned from the test instrument, one 0.92 Mc/s higher in frequency than the other. In all cases the desired frequency is the lower of the two.

A convenient alignment jig designed to hold the receiver chassis and fitted with a dial scale and pointer may be obtained from the Service Dept. of the Company. With this jig, alignment may be carried out with the chassis coupled to an actual scale, thus ensuring that the calibration will be correct when the chassis is placed in the cabinet, otherwise use the 0-180° calibration scale on the drum. (See alignment table.)

For all alignment purposes, connect the low side of the signal generator to the receiver chassis.

Perform alignment in the proper order, as shown in the chart, starting from No. I and following all operations across, then No. 2, etc.

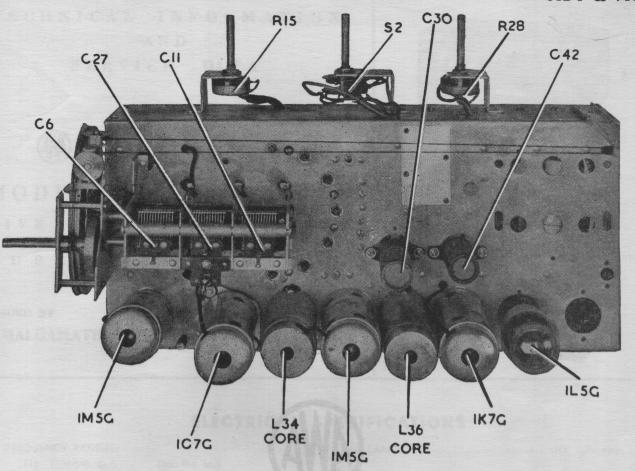

Keep the volume control set in the maximum clockwise position and regulate the output of the test instrument so that a minimum signal is introduced to the receiver to give a standard indication on the output meter. This will avoid A.V.C. action and over-loading.

When the receiver has been satisfactorily aligned, seal the adjusting screws with a small quantity of cellulose cement.

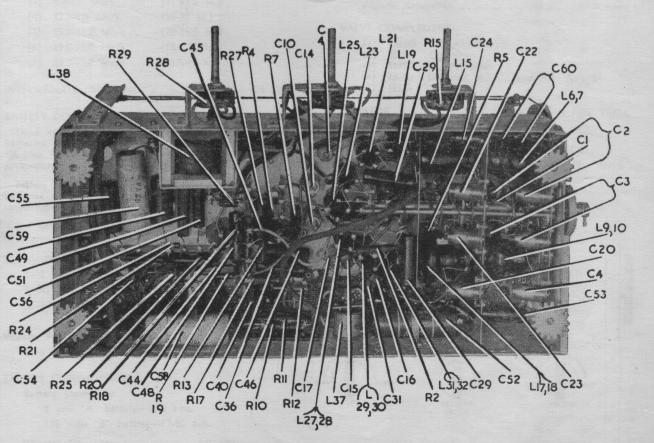

* If a type J6726 or C1070 instrument is used, see that a 0.25 megohm resistor is connected between the output terminals, and, for short wave alignment, a 400 ohm non-inductive resistor in series with the active output lead.

^{*} A.V.C. bias on M/W and 75-200 M. bands.

[†]Zero bias on M/W and 75-200 M., A.V.C. on other bands.

| | • | | Recheck | | d 21 | | |
| 22 | Aerial | 1.6 Mc/s | 4.0-1.5 Mc/s | 15° | Oscillator | Core L29 | Calibration |
| 23 | Aerial | 3.7 Mc/s | 4.0-1.5 Mc/s | 153° | Oscillator | C17 | Max. Peak |

Finally, recheck broadcast band. This is necessary only if the setting of C10 has been altered.

The column headed "Calibration Scale Setting" refers to the 180° scale on the ganged tuning capacitor drive drum. In taking readings on this scale, read from the right-hand edge of the pointer; that is the edge nearest the rear of the chassis. Check the setting of the drum before taking readings. The zero mark should be opposite the pointer with the tuning capacitor fully closed.

DESCRIPTION OF TUNING CIRCUIT ADJUSTMENTS

Broadcast Band.

The broadcast band adjustments follow usual practice with three trimming capacitors—C4 aerial, C20 R.F., C8 oscillator and a variable magnetite core for L.F. adjustment of the oscillator coil L31, L32.

9.7-3.6 Mc/s Band.

Adjustments are the same as those used on the broadcast band, that is with three trimming capacitors—C60 aerial, C24 R.F., C14 oscillator and a variable magnetite core for L.F. adjustment of the oscillator coil L27, L28.

4.0-1.5 Mc/s Band.

All capacitors in the aerial and R.F. sections are common with those in the 9.7-3.6 Mc/s band, the change of band being accomplished by switching tapped coils. The oscillator section, however, is provided with a separate capacitor, C17, for tracking with the signal circuit at the H.F. end, and a variable magnetite core for L.F. adjustment of the oscillator coil L29, L30.

22.3-17.7 Mc/s Band.

At the L.F. end of this band there are three adjustments, a magnetite core in the oscillator coil L19, L20 and trimming capacitors C22 R.F. and C2 aerial. Small capacitors C1, C21 and C7 are used in series with the ganged tuning capacitors to accomplish band spreading at the L.F. end of this band. The oscillator circuit is made to track with the signal ciruit at the H.F. end by adjustment of capacitor C10. The three series capacitors are chosen to give three point tracking between the signal and oscillator circuits.

19.0-15.0 Mc/s Band.

The capacity system is the same as for the 22.3-17.7 Mc/s band, the change of band being accomplished by switching coils, the oscillator coil L21, L22 being fitted with a variable magnetite core for L.F. adjustment.

15.0-11.7 Mc/s Band.

Adjustments are similar to those on 22.3-17.7 Mc/s band, excepting that no H.F. adjustment is provided for the oscillator L.F. Adjustments are trimming capacitors C23 R.F., and C3 aerial, and a variable magnetite core in oscillator coil L23, L24.

12.0-9.4 Mc/s Band.

One adjustment only is provided, a variable magnetite core in the oscillator coil L25, L26.

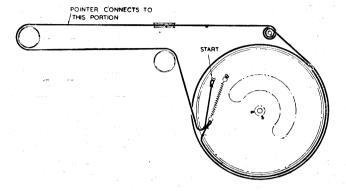

It will be noted that the Ratio min. frequency min. frequency is the same on the four band, 12.0-9.4 Mc/s, 15.0-11.7 Mc/s, 19.0-15.0 Mc/s, 22.3-17.7 Mc/s, and the tracking is practically correct using the same series capacitor for all bands. The ratio max. frequency min. frequency min. frequency is also the same on the 4.0-1.5 Mc/s and the 9.7-3.7 Mc/s bands, but, due to the greatly different frequency spectrum of the oscillator, the series capacitors in the two oscillator circuits are different.

[†] Rock the tuning control back and forth through the signal.

^{*} With Grid Clip connected. A 0.001 uF capacitor should be connected in series with the "high" side of the test instrument.

TUNING DRIVE CORD REPLACEMENT.

The accompanying diagram shows the route of the cord and the method of attachment. Whilst fitting the cord, keep it taut and adjust the length so that the tension spring measures approximately 2 inches long when fitted. The spring should be sheathed to prevent it rattling against the drum.

LOUDSPEAKER SERVICE.

It is inadvisable to attempt loudspeaker repairs other than adjustment of the voice coil and replacement of the transformer. The fitting of a new cone should be done only by service departments suitably equipped to do the work.

To centre the voice coil, first remove the dust cover. To do this, use a very sharp razor blade and cut the centre out of the dust cover, cutting just inside the edge of the voice coil former, which can be felt with the fore-finger. Do not attempt to tear the cover from the cone. Loosen the suspension screws, insert three narrow paper "feelers" in the gap and re-tighten the suspension screws. The "feelers" should be approximately 3/16 inch wide and 0.006 inch thick.

After adjusting, test the loudspeaker, and, if satisfactory, fasten a replacement dust cover in place with Latex rubber cement. See "Mechanical Replacement Parts."
