TUBE PLACEMENT CHART

ALIGNMENT INSTRUCTIONS

ALIGNMENT INSTRUCTIONS—READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT

The alignment frequencies for models 2291, 2292, 2293, 2294 and 2295 are indicated by an asterisk (*). The alignment frequencies for models 2297 and 2298 are indicated by a dagger (†). Determine the model set to be aligned and use the frequencies for that set.
If the set is to be aligned with the picture tube removed, the high voltage power supply should be disabled by removing the horizontal oscillator tube (VI7).

VIDEO IF ALIGNMENT

Remove the channel 13 segment of the oscillator section (front) of the tuner turret. Turn the channel selector switch to channel 13 during video IF alignment. This disables the local oscillator and removes the possibility of erroneous indications.
Turn the contrast control to maximum clockwise position.

OVERALL VIDEO IF RESPONSE CHECK

Set the contrast control to read 2.5 volts on VTVM connected across C35. If the set is to be operated in a "fringe" area, set this voltage to approximately 1 volt.

OSCILLATOR ALIGNMENT

The overall oscillator circuit adjustment (A12) is pre-set at the factory and should not require further adjustment in the field.

The individual channel oscillator adjustments are reached through a hole just to the right of the channel switch shaft. The correct adjustment screw is accessible through this hole as the channel switch is turned to each channel.

Replace the channel 13 segment of the tuner turret.

Set the fine tuning control to the mid-position of its range.

ALIGNMENT INSTRUCTIONS (CONT.)

RF and MIXER ALIGNMENT

The RF and mixer lines of these receivers have been properly aligned at the factory and the adjustments are very stable. Alignment should not be attempted unless they are definitely known to be out of alignment.

The sweep generator output lead should be terminated with its characteristic impedance, usually 50 ohms. Set the contrast control to read 1.5 volts on VTVM connected across C35.

HORIZONTAL SWEEP CIRCUIT ADJUSTMENTS

HORIZONTAL OSCILLATOR AND LINEARITY ADJUSTMENTS

Tune in a TV station, preferably a test pattern, and sync the picture vertically with the vertical hold control.

Turn the horizontal hold control to its maximum clockwise position. Adjust the horizontal frequency trimmer (B1), and the horizontal frequency slug (B2) until the picture is just out of sync and the blanking bar appears in the picture as a vertical bar.

Turn the horizontal hold control 1/4 turn counter-clockwise: the picture should synchronize normally.

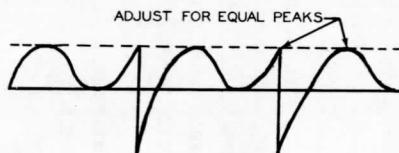

Adjust the horizontal drive (B3), horizontal width (B4), and the horizontal linearity (B5) alternately until the picture is symmetrical from left to right. If adjustment of B3, B4, or B5 was necessary, repeat the adjustments of B1, and B2.

HORIZONTAL WAVEFORM ADJUSTMENT

Connect the vertical amplifier of an oscilloscope thru 1 megohm to terminal "C" of the horizontal oscillator transformer.

Turn the horizontal hold control to sync the picture horizontally.

Adjust the waveform adjustment (B6) until the broad and narrow peaks are of equal amplitudes (See Fig. 5 below). If necessary, keep the picture in sync with the hold controls while making this adjustment.

§ Measured from pin 3 of V16.

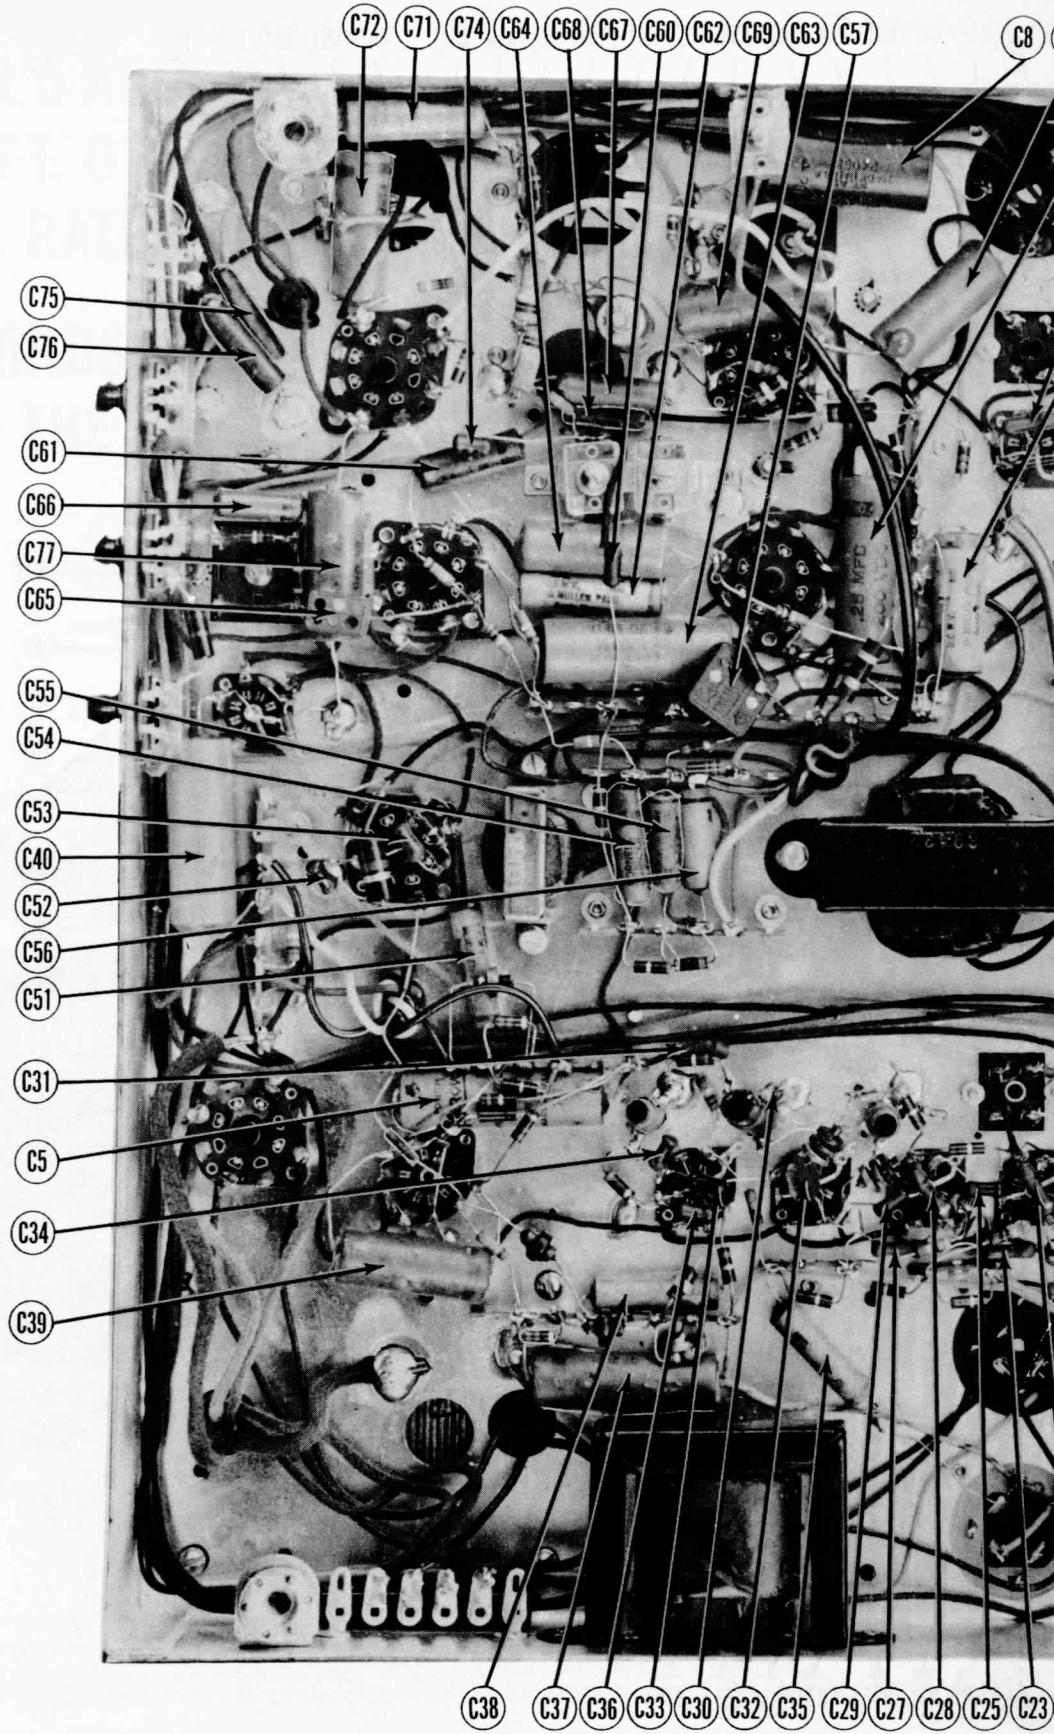

- DC Voltage measurements are at 20,000 ohms per volt; AC Voltage measured at 1,000 ohms.
- Pin numbers are counted in a clockwise direction on bottom of socket.
- Measured values are from socket pin to common negative unless otherwise stated.
- Line voltage maintained at 117 volts for voltage readings.
- Front panels controls set at minimum.
- Where readings may vary according to the setting of the service controls, both minimum and maximum readings are given.

Note 1. Some models use 8200Q resistor in this application.

Note 2. Not used in all models.

Note 3. Not used in early production models.

Note 4. Some models use 5.6Q resistor in this application.
