## R AND INDUCTOR IDENTIFICATION

## CABINET-REAR VIEW MISCELLANEOUS ADJUSTMENTS

### HORIZONTAL SWEEP CIRCUIT ADJUSTMENT

Connect a short between terminals C and D of L37.  
 Turn the set on and tune in a TV station, preferably a test pattern.  
 Turn the horizontal hold control to maximum clockwise and adjust the horizontal frequency slug (B1) until the blanking signal appears as a single vertical line in the picture.  
 Turn the hold control 1/4 turn counter-clockwise to synchronize the picture.  
 Adjust the horizontal drive trimmer (B2) clockwise as far as possible without crowding the right side of the picture.  
 Adjust the width control until picture is of proper width.  
 Adjust the horizontal linearity slug (B3) until the picture is symmetrical from left to right, slight readjustment of B2 may be required for optimum results.  
 Turn the hold control fully counter-clockwise and interrupt the signal by switching to another channel and back again.  
 Turn the hold control clockwise and note the least number of bars present just before the picture pulls into synchronization.  
 Adjust the horizontal locking trimmer (B4) until 7 to 9 bars are present just before pull in.

### HORIZONTAL WAVEFORM ADJUSTMENT

Remove the short from terminals C and D of L37.  
 Turn the horizontal hold control fully clockwise and adjust the waveform slug (B5) until the blanking signal appears as a single vertical line in the raster.  
 Turn the hold control 1/4 turn counter-clockwise to synchronize the picture.  
 Connect the vertical input of an oscilloscope to terminal C of L37.  
 Adjust the horizontal waveform slug (B5) until the broad and narrow peaks of the waveform are of equal height as shown in figure 9. If necessary during adjustment of B5 turn the hold control to keep the picture in synchronization.  
 Turn the hold control to maximum counter-clockwise and momentarily remove the signal. Adjust B4 until two bars are present just before the picture pulls into synchronization as the hold control is turned clockwise.  
 Turn the hold control to maximum clockwise and adjust B1 until the blanking bar appears in the raster.  
 Turn the hold control 1/4 turn counter-clockwise to synchronize the picture.

### AGC SWITCH ADJUSTMENT

In a strong signal area the normal position of the switch is counter-clockwise. If interference of the impulse type is encountered turn the switch to the center position. In very weak signal areas, turn the switch clockwise.

### FM TRAP ADJUSTMENT

If interference is encountered from a strong FM station signal it may be possible to eliminate it by adjusting A38. Adjust A38 for minimum interference in the picture.

# TV ALIGNMENT INSTRUCTIONS

## ALIGNMENT INSTRUCTIONS—READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT

The high voltage shock hazard may be eliminated by removing the horizontal oscillator tube (V16) from its socket.

The plug on the focus and deflection assembly must be in place to operate the set.

Remove the converter tube (V2) and replace it with a 6J6 which has pin 1 removed. This will disable the local oscillator and prevent erroneous indications.

### VIDEO IF ALIGNMENT

Connect the negative lead of a 3 volt battery to the junction of R25 and R26, connect the positive lead to chassis.

\* NOTE: In later productions, receivers where R40 is 1800Ω, R45 is 18KΩ and L26 has been added, the frequencies to which A9 and A10 are tuned have been reversed. In those receivers, A9 is tuned to 24.35MC, and A10 is tuned to 22.5MC.

## RF TUNER ALIGNMENT

Remove the dummy converter tube and replace the original 676 in its socket. Disconnect the co-ax link from terminal 2 of the tuner terminal board and connect a $39\Omega$ carbon resistor across terminals 1 and 2. Loosely couple the link to terminal 2 of the terminal board. Connect the negative lead of the 3 volt battery to terminal 3 of the terminal strip, connect the positive lead to chassis. The sweep generator output lead should be terminated with its characteristic impedance, usually 50 ohms. Set the fine tuning control to the mid-position of its range.

17. Connect VTVM to Point D and adjust A24 for -3 volt reading. If necessary slightly retouch A21, A22, A23 and A17 for proper response on channel 6. Repeat these retouching adjustments until proper response is obtained with -3 volt reading at Point D.							
18. Two $120\Omega$ carbon res.	Across antenna terminals with $120\Omega$ in each lead.	Not used	185.75MC	8	VTVM DC Probe to Point D Common to chassis.	A15	Adjust for zero reading. A positive and negative reading will be obtained on either side of the correct setting.

If A19 is adjusted, the adjustment should be over shot a small amount and compensated for by adjusting A25 for maximum amplitude between the sound and video markers. If the valley in the top of the curves on the high channels seems deeper than normal adjust A27 to flatten the curve. In later productions A27 may be fixed and will not require adjustment.
23. Check the oscillator frequency for the high band channels. If the oscillator is off frequency, overshoot the adjustment of A15 and compensate for it by adjusting A26 for zero voltage at Point B.							
24. Repeat step 15.

30. Turn channel switch to channel 8 and adjust A24 for proper response. When A24 is properly adjusted the curve will be slightly wider with a slightly deeper valley at the top. Check all channel for: (1) proper response, (2) oscillator injection voltage at Point D, and (3) oscillator frequency. Make slight touch up adjustments, if necessary. If A16 and A24 are changed considerably, retouch the oscillator frequency on all channels.							
31. Disconnect the $39\Omega$ resistor from terminals 1 and 2 on the terminal strip and reconnect the co-ax link. Repeat steps 11 and 12 of Video IF Alignment.							

# RADIO ALIGNMENT INSTRUCTIONS

## ALIGNMENT INSTRUCTIONS—READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT

Remove the plastic radio cover containing the dial scale and 45RPM record player.  
Turn the tuning gang fully closed. Set the dial pointer to the calibration mark near the left hand end of the dial backplate.  
Replace the plastic cover.

### AM ALIGNMENT

Any adjusting done on the 455KC IF's will necessitate alignment of the 10.7MC FM IF's.  
Loop should be maintained in same relative position to chassis as when receiver is in cabinet.  
Volume control should be at maximum position. Output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.  
Alternate loading of the IF transformers is used.  
Connect 47KΩ resistor across the primary of each transformer while the secondary of the same transformer is being adjusted.  
During secondary adjustment move the 47KΩ resistor to across the primary.

### FM IF ALIGNMENT USING AM SIGNAL GENERATOR AND VTVM

Connect two matched 100KΩ ( $\pm 1\%$ ) resistors in series from point E to chassis. The junction of these two resistors is alignment point G as shown on the schematic.

Alternate loading is used on all FM transformers except the discriminator transformer L36. Connect a 680 ohm resistor across the primary of each transformer while the secondary of the same transformer is being adjusting. During primary adjustment move the 680 ohm resistor to across the secondary.

# MEASURED FROM PIN 8 OF V18

# MEASURED FROM PIN 3 OF V18

- DC Voltage measurements are at 20,000 ohms per volt; AC Voltage measured at 1,000 ohms.
- Pin numbers are counted in a clockwise direction on bottom of socket.
- Measured values are from socket pin to common negative unless otherwise stated.
- Line voltage maintained at 117 volts for voltage readings.

- Front panels controls set at minimum.
- Where readings may vary according to the setting of the service controls, both minimum and maximum readings are given.

## RF TUNER- REAR VIEW DISASSEMBLY INSTRUCTIONS

### TV CHASSIS REMOVAL

1. Remove seven push-on type control knobs.
2. Remove six screws holding rear cover in place. Remove rear cover.
3. Disconnect built-in antenna.
4. Disconnect speaker.
5. Disconnect audio lead.
6. Disconnect ground lead from picture tube.
7. Remove six 7/16" hex head bolts from chassis. Remove chassis.
8. Remove four 11/32" nuts from speaker. Remove speaker.

### RADIO CHASSIS REMOVAL

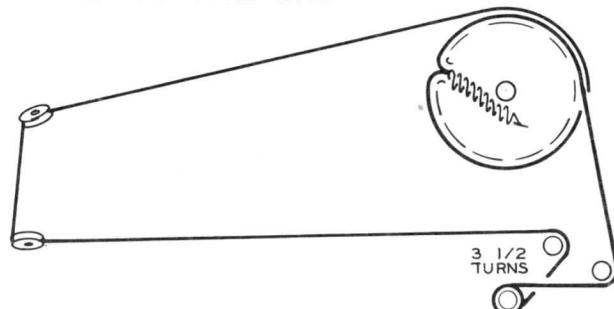

1. Remove five push-on type control knobs.
2. Disconnect built-in AM antenna.
3. Disconnect FM antenna.
4. Disconnect phono leads.
5. Remove wood screw at rear of track.
6. Remove three 1/4" hex head screws fastening rear cover.
7. Remove radio and 45RPM phonograph unit from rear of cabinet.

### 33 1/3-78 RPM PHONOGRAPH REMOVAL

1. Remove the fillister head machine screw at rear of 33 1/3 - 78 RPM phono track.
2. Remove from front of cabinet.

NOTE: FOR PICTURE TUBE REMOVAL, IT IS NECESSARY TO REMOVE THE TV CHASSIS AS OUTLINED ABOVE.
